II. Relevant results on Energy and Environment management

III. Energy Management technologies for High Speed

IV. Sharing Spanish experience with Indian HS projects:  
Simulation of Energy savings over Thane-Nasik stretch (*feasibility study of New HSL Mumbai-Kolkata / phase 1: Mumbai-Nagpur*)

# Adif + Adif AV. Global Figures

- **Main investor in Spain**, in last 25 years (around 57 bn \$)

|              |                    |                      |
|--------------|--------------------|----------------------|
| In 2007-2016 | High Speed:        | 36,000 M€ (40 bn \$) |
|              | Conventional Rail: | 6,000 M€ ( 7 bn \$)  |

- **Staff:** 13,041 employees

**Managed Rail Network:** 15,296 km (9,504mi)

**High Speed UIC gauge 1,435 mm :** 2,590 km (1,609mi)

100% electrified AC

**Conventional Lines (Iberian gauge 1,668 mm):** 11,483 km (7,135 mi)

Out of which 616 km (383 mi) with HS parameters

80 % electrified DC

**Mixed Gauge Network (UIC + Iberian gauge)** 119 km (74 mi)

Out of which 22 km (13 mi) with HS parameters

100 % electrified DC

**Metric gauge 1,000 mm:** 1,207 km (750 mi)

- **HS Lines under construction or project:** 2,779 km (1,727 mi )

- **Managed Traffic:** 2.1 M trains /year 5,775 trains/day

198.3 M pass train-km/year 541,849 M pass trains-km/day **50,2% HSL**

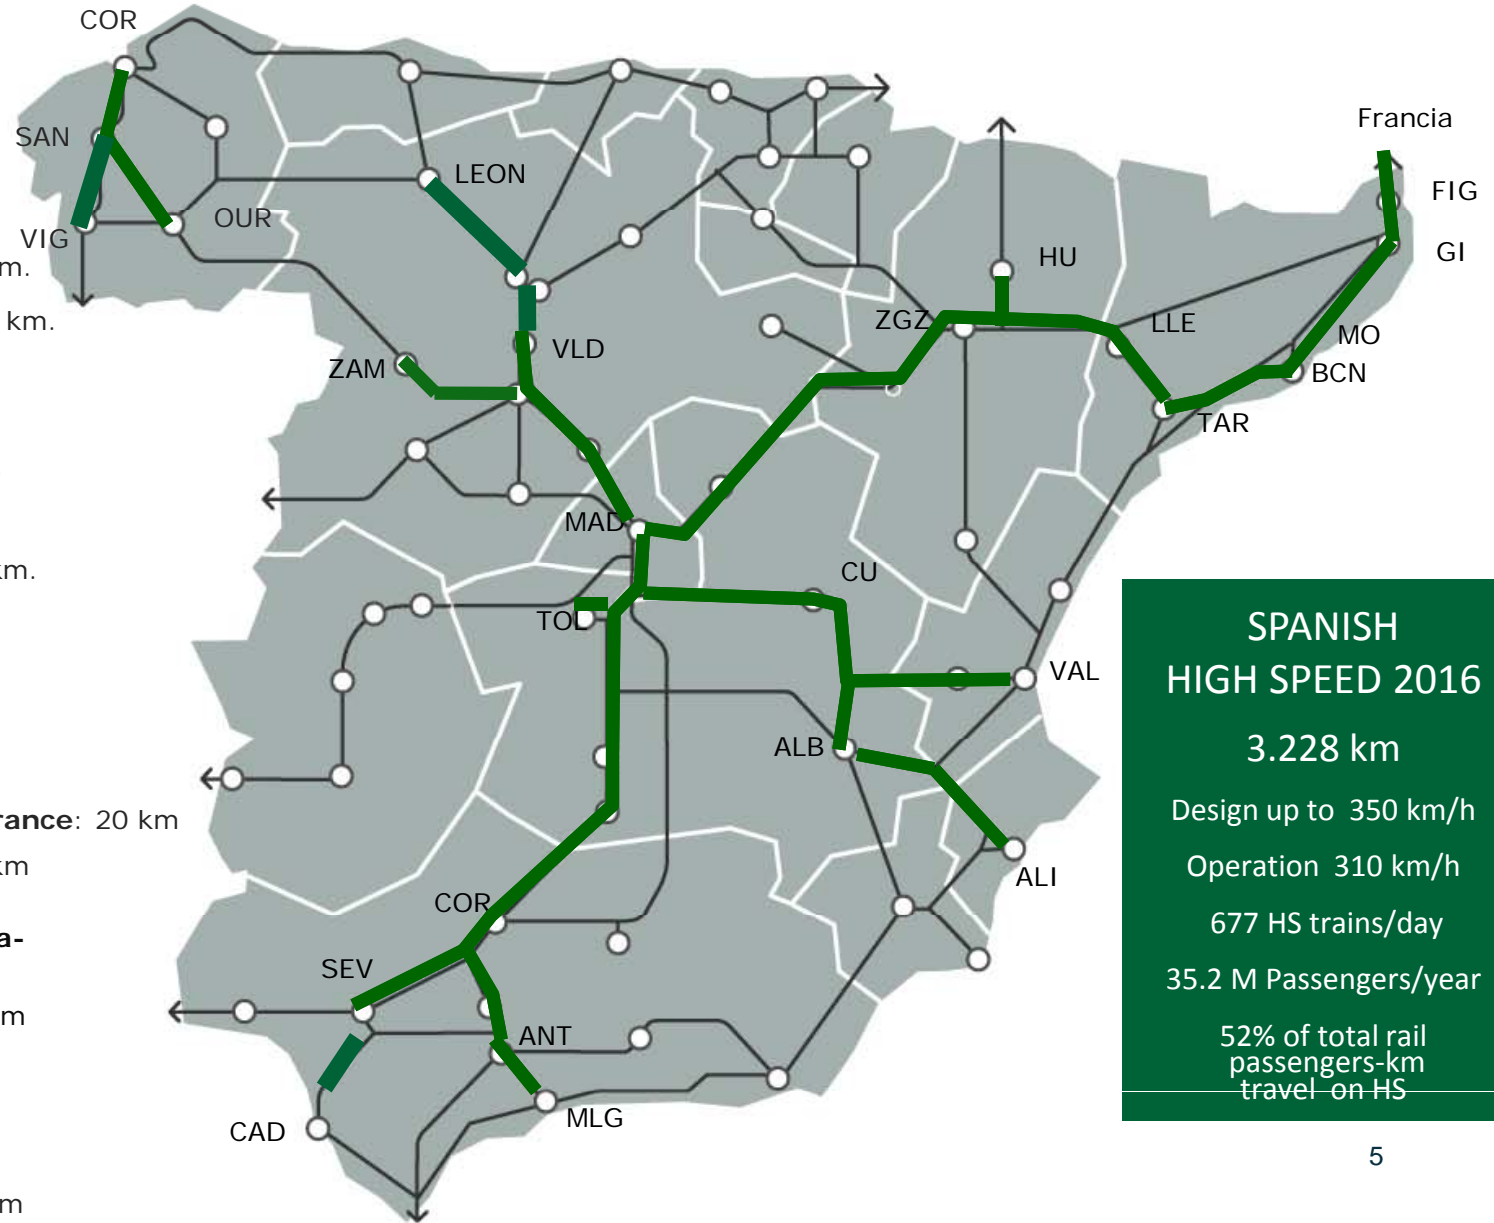

- **Passengers:** 468 million passengers/year (36 million HS)

# HS Lines. Landmarks

The Spanish network, a continuous evolution from 1992

- 1992 - **Madrid-Sevilla:** 471 km
- 2003 - **Madrid-Lleida:** 468 km  
(200 km/h ASFA).
- Zaragoza-Huesca:** 79 km
- 2005/06 **Lleida-Tarragona:** 95 km.
- Córdoba-Antequera:** 100 km.
- Connection to Toledo :** 21 km.
- 2007 - **Madrid-Lleida:** 468 km  
(300 km/h from May 2007)
- Madrid-Valladolid:** 181 km.
- Antequera-Málaga:** 55 km.
- 2008 - **Tarragona-Barcelona:** 88 km.
- 2010 - **Madrid-Cuenca:** 183 km.
- Madrid-Albacete:** 315 km.
- Madrid-Valencia:** 391 km
- Mollet – Girona:** 75 km
- Intern. Connection with France:** 20 km
- 2011 - **Ourense – A Coruña:** 150 km  
(Iberian gauge 1.668 mm)
- 2013 - **New Connection Barcelona-  
French Border** 131 km
- Albacete – Alicante:** 165 km
- 2015 - **Santiago C. – Vigo:** 94 km  
(Iberian gauge 1.668 mm)
- Sevilla – Cádiz :** 71 km  
(Iberian gauge 1.668 mm)
- Valladolid – León:** 166 km
- Olmedo – Zamora:** 103 km

**SPANISH  
HIGH SPEED 2016**

**3.228 km**

Design up to 350 km/h  
Operation 310 km/h

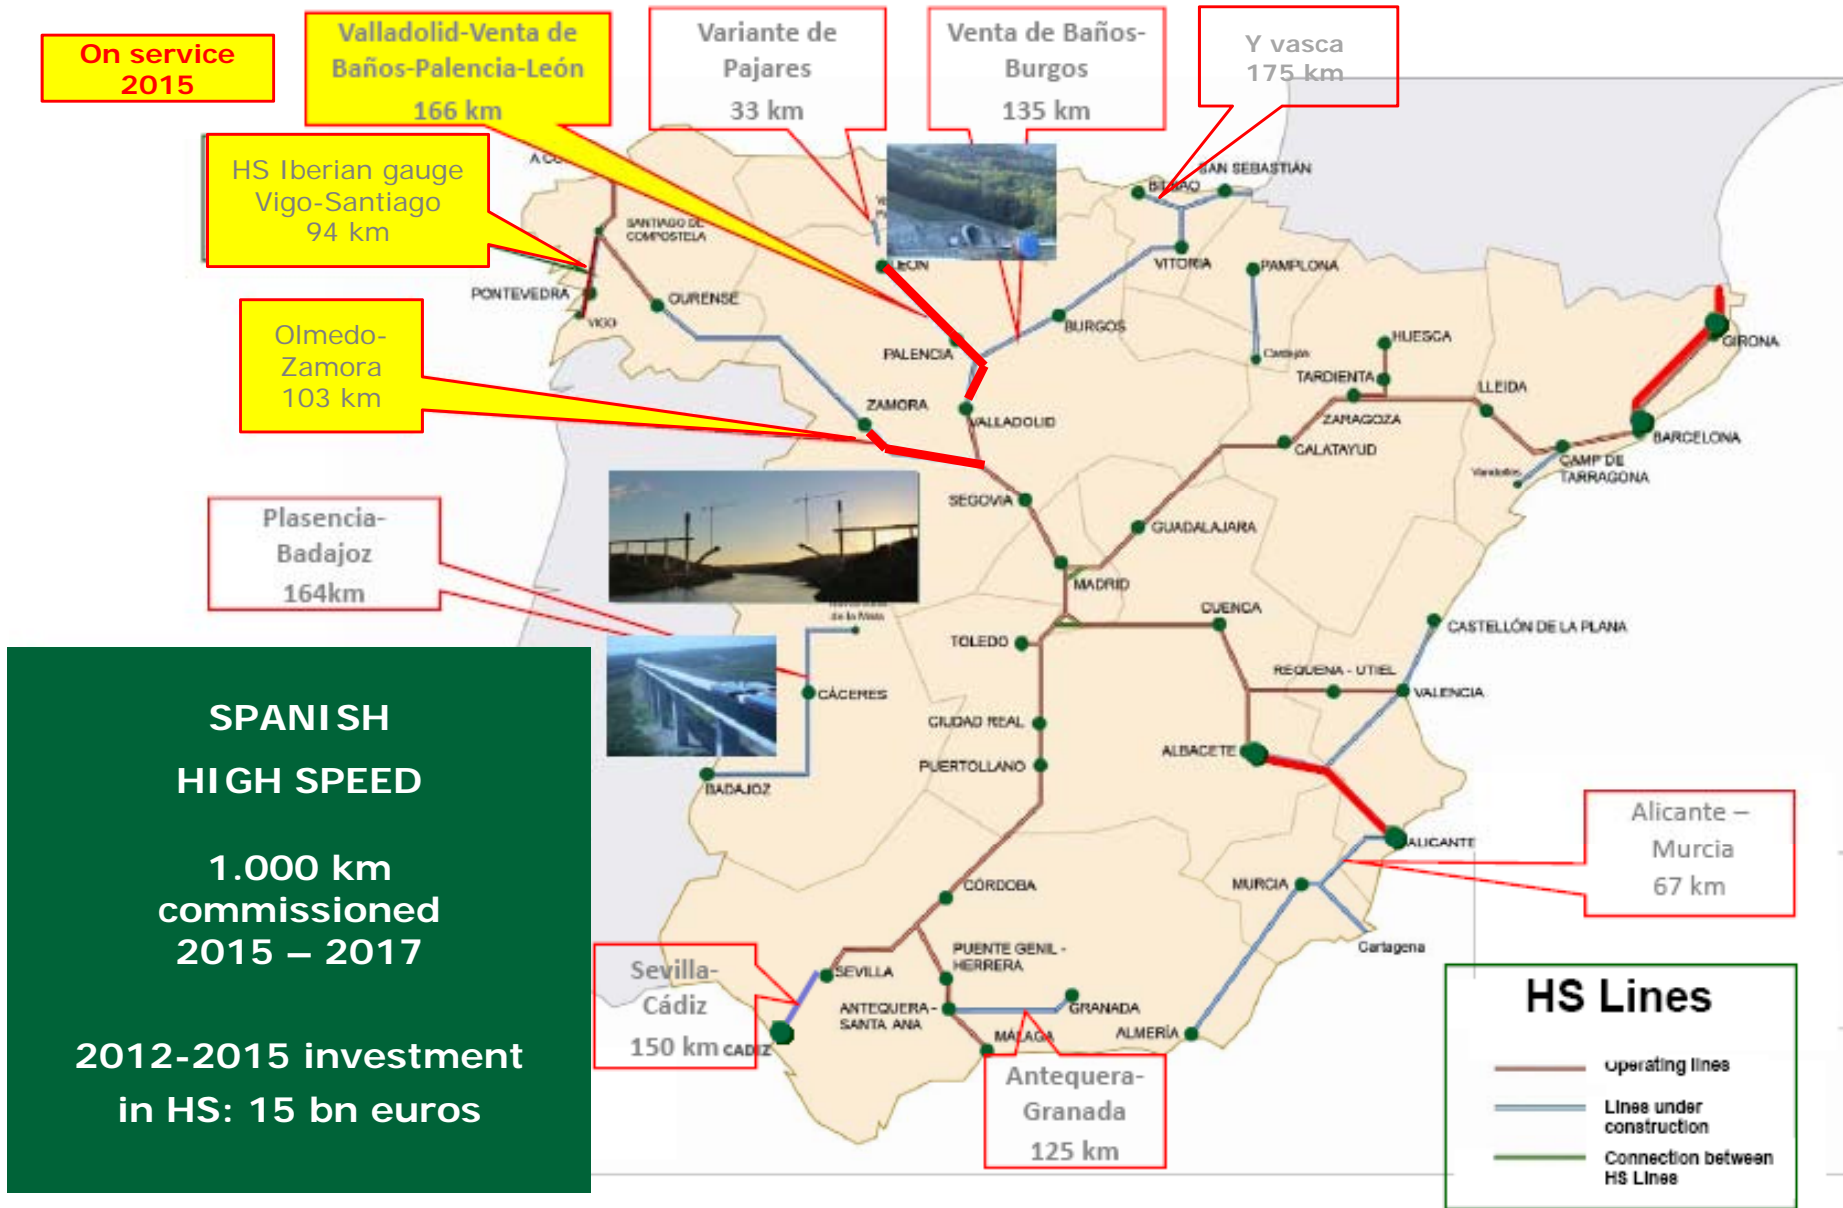

677 HS trains/day

35.2 M Passengers/year

52% of total rail  
passengers-km  
travel on HS

# HS Lines. Overview

# 2015 - 2017 Current Works

ON SERVICE SEPTEMBER 2017

# Stations

Madrid Puerta Atocha

Málaga María Zambrano (VIALIA)

Cuenca Fernando Zóbel (Brunel Award 2011)

## 47 High Speed Train Stations + 1.900 Conventional Lines Stations

- Adif has great expertise in Stations commercial management and income-generating activities.
- VIALIAs are a PPP system that provide funding for the design and construction of Stations and ensure revenues for concession holders and for Adif

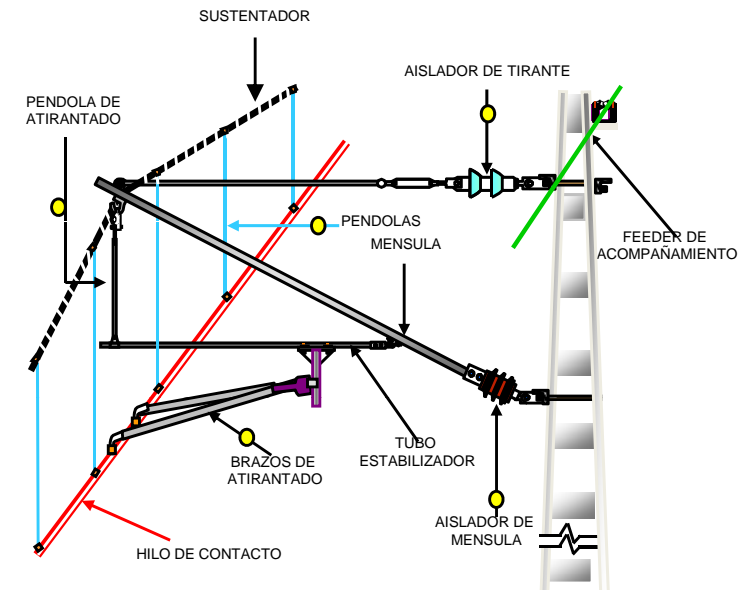

# Improvements actions on Conventional Lines

Improved lines    Maximum speed 160 -> 200 -> 220 km/h

- Doubling of track (from single track case)
- Local new track sections to increase speed
- Track with UIC60 rail and monobloc concrete sleepers
- Installation of new jointless turnouts:
  - Deviations: 100 km/h
  - Siding tracks: 100 km/h
- New Catenary suitable for 220 Km/h
- New Signaling Equipments
- Elimination of Level Crossings
- Fencing
- Elimination of steel bridges without ballast

## Catenary CR 220

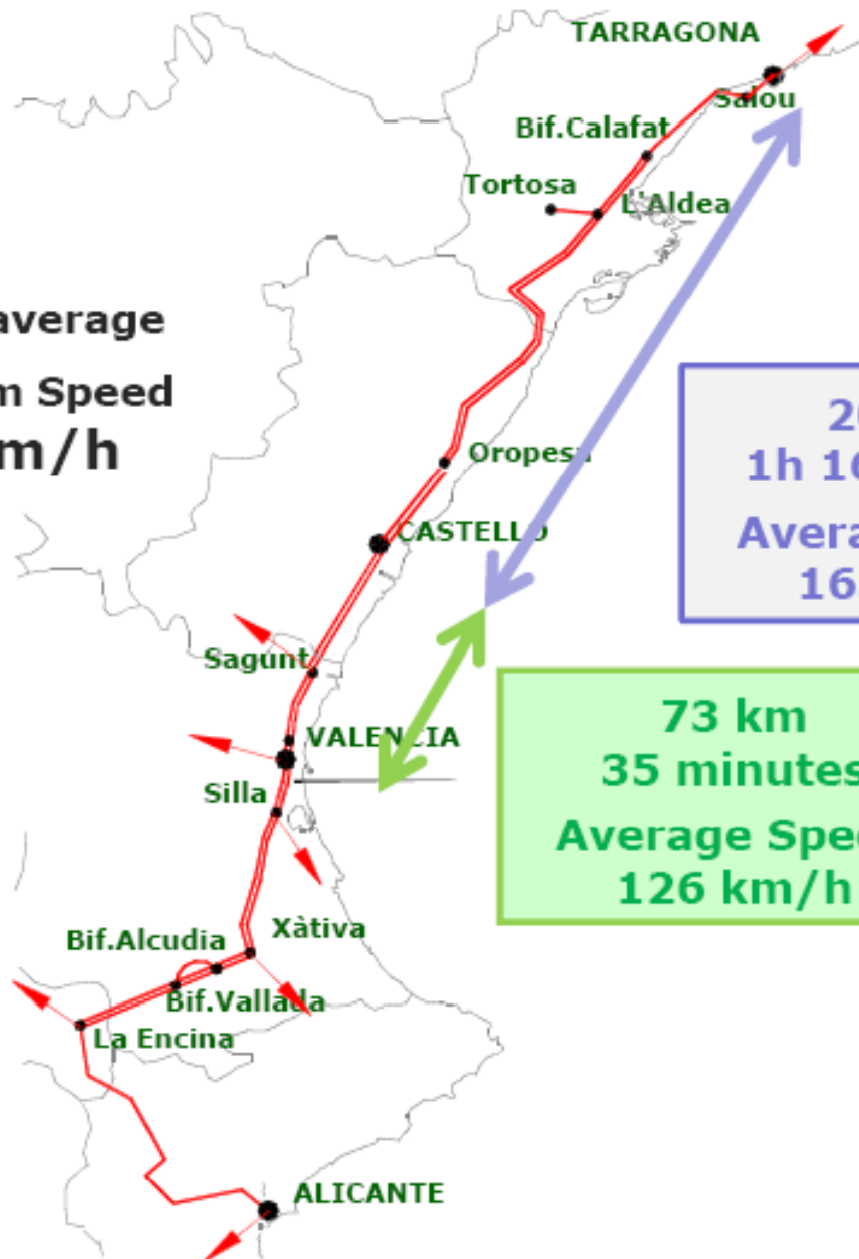

## Unified Turnouts

# Improving conventional lines: Mediterranean Corridor

Weighted average  
of Maximum Speed  
**197 Km/h**

# Interoperability. Gauge exchangers

- Automatic axle gauge exchangers for Standard and Spanish gauge performed at 20 km/h
- Technology of three rails track for Spanish and Standard gauge

## II. Relevant results on Energy and Environment management

III. Energy Management technologies for High Speed

IV. Sharing Spanish experience with Indian HS projects:  
Simulation of Energy savings over Thane-Nasik stretch (*feasibility study of New HSL Mumbai-Kolkata / phase 1: Mumbai-Nagpur*)

# ADIF, a clear and robust framework to support environmental and energy savings goals

- **BUSINESS PLAN 2012-2016**
  - Protecting Environment
- **ENVIRONMENTAL POLICY** (ADIF's Chairman, June 2015)
- **PLAN FOR SOCIAL RESPONSIBILITY AND SUSTAINABILITY 2013-2016**
  - \* Good government      \* Economic Dimension
  - \* Social Dimension      \* Environmental Dimension
  - Environmental intergration of infrastructures
  - Contribution to the fight against climate change and efficient management of resources
  - Compliance with environmental legislation
  - Biodiversity protection
- **MASTER PLAN FOR SAVINGS AND ENERGY EFFICIENCY 2009-2014 & 2014-2020**
- **CERTIFIED MANAGEMENT SYSTEMS ISO 14001: OBJECTIVES AND GOALS FOR CONTINUOUS IMPROVEMENT**

## Política de Medio Ambiente de Adif y Adif Alta Velocidad

Junio 2015

La planificación de las actividades de Adif y Adif Alta Velocidad consideran los conceptos de gestión sostenible, eficiencia y seguridad, que garanticen una adecuada gestión de los recursos y una protección ambiental.

Como expectativa de los grupos de interés, se identifica la gestión responsable de los recursos que se traduce en proyectos que aporten valor y bienestar a la sociedad.

Las directrices sobre la gestión y coordinación de actividades ambientales fija las responsabilidades y responsabilidades de los procesos ambientales en Adif y Adif Alta Velocidad, aprovisionando las sinergias entre diferentes áreas, con objeto de minimizar los posibles riesgos ambientales.

Desde la entrada en vigor el 21 de diciembre de 2013 de los artículos Adif y Adif-AR, se hace necesario actualizar y regular las funciones de ambas en el desarrollo de las actividades ambientales. Ello se plasma en la Adenda al Convenio de cooperación de gestión suscrito por el Administrador de Infraestructuras Ferroviarias (Adif) y Adif Alta Velocidad el 21 de enero de 2014 para la ejecución de Adif Alta Velocidad de la gestión integral ambiental y la gestión integral de la supervisión, del soporte técnico y de los servicios a obra, en cuyo objeto se encuentra la prestación por Adif Alta Velocidad a Adif del servicio de gestión integral medioambiental.

En base a todo lo expuesto, Adif y Adif Alta Velocidad asumen para su gestión ambiental, los siguientes compromisos en su POLÍTICA DE MEDIO AMBIENTE:

1. Impulsar compromisos para la mejora del desempeño ambiental sobre la base de la implantación, auditoría y certificación periódica de sus criterios ambientales, basados en la norma ISO 14001.
2. Asegurar que siempre se actúa de conformidad con las obligaciones de cumplimiento legal así como otras exigencias de aplicación, y en colaboración con los Organismos oficiales encargados de su supervisión.
3. Lograr la integración ambiental del ferrocarril manteniendo el máximo respeto hacia los espacios naturales y el patrimonio arqueológico, preservando todos sus valores y recuperando aquellos entornos que se hayan podido ver afectados.
4. Requerir de las empresas filiales, contratistas y proveedores idéntico compromiso ambiental, mediante la suscripción de los documentos contractuales correspondientes.
5. Definir procedimientos internos que garanticen la protección del medio ambiente y la prevención de la contaminación durante todas las fases del ciclo de vida, con atribución precisa de las responsabilidades así como de las herramientas internas para su control y seguimiento.
6. Desarrollar planes de disminución del consumo energético y las emisiones de CO<sub>2</sub>, tanto en la construcción, como en el mantenimiento y la explotación de infraestructuras e instalaciones ferroviarias.
7. Racionalizar el consumo de agua así como la generación de residuos y de aguas residuales, minimizar la afectación a los suelos así como recuperar aquellos que hayan sido contaminados y adoptar todas las medidas técnicas, accesorias y legales con el fin de reducir al máximo el impacto por ruido y vibraciones en las fases de diseño, construcción y explotación de infraestructuras e instalaciones ferroviarias.
8. Determinar el riesgo ambiental asociado con amenazas y oportunidades, así como considerar el factor ambiental en las estrategias empresariales.
9. Implantar programas específicos de formación y sensibilización ambiental para el personal operativo, técnico y directivo de todas las unidades organizativas de Adif y Adif Alta Velocidad.
10. Promover el compromiso con el medio ambiente desde la Alta Dirección. Proveer los recursos humanos, económicos y materiales necesarios para garantizar el cumplimiento de estos compromisos y comunicar públicamente los resultados de su aplicación en aras de la transparencia.

Los principios de la Política de Medio Ambiente configuran el marco en el que se establecen los objetivos y metas de Adif y Adif Alta Velocidad con el fin de contribuir a la mejora ambiental y al logro de la sostenibilidad del sistema ferroviario.

### RESULTS ON OUR OWN ACTIVITIES AS INFRASTRUCTURE MANAGER

Electric energy consumption (Million kWh/year)

8b2. Consumo de Energía Eléctrica en las actividades propias (Mill. kWh/año)

Fuel consumption (Million l/year)

8b3. Consumo de Gasóleo en las actividades propias (Mill. l/año)

Water consumption (Million m<sup>3</sup>)

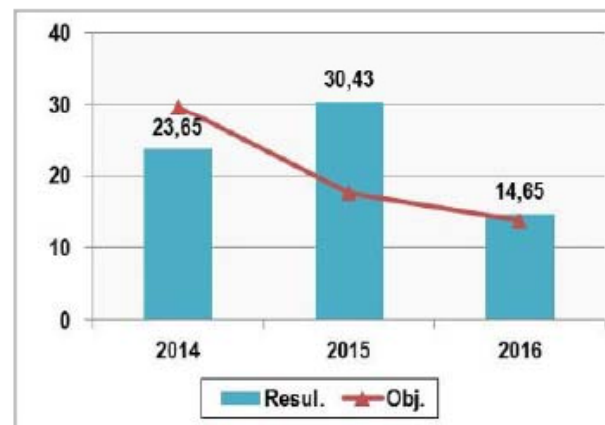

8b1. Consumo de agua en las actividades propias de Adif (Mill. de m<sup>3</sup>)

Total Savings on GWh equivalent

8b5. Ahorro total en GWh equivalentes

Total Savings on CO<sub>2</sub> tons

8b6. Ahorro total en toneladas de CO<sub>2</sub>

Energy efficiency. Total Saving (Million €)

9b7. Eficiencia energética. Ahorro total (Mill. de €)

# WORK SITES: KEY PERFORMANCE INDICATORS AND ENVIRONMENTAL OBJECTIVES

## OBJECTIVE

- 1 MINIMIZE THE SURFACE OCCUPIED
- 2 PRESERVE AREAS OF NATURAL INTEREST
- 3 PRESERVE CULTURAL HERITAGE
- 4 PRESERVE SOILS
- 5 PRESERVE FLUVIAL SYSTEM AND VEGETATION
- 6 PREVENT POLLUTION
- 7 PRESERVE FAUNE 
- 8 RESTORATION OF NATURAL ENVIRONMENT WITH ECOLOGICAL AND LANDSCAPING APPROACH

2 EXAMPLES

Contribution from different sources to Greenhouse Gaz Effect (on %)

Indirect emissions from registered consumption of electricity

# MASTER PLANS FOR SAVINGS AND ENERGY EFFICIENCY 2009-2014      2014-2020

## PLAN DIRECTOR DE AHORRO Y EFICIENCIA ENERGÉTICA 2014-2020

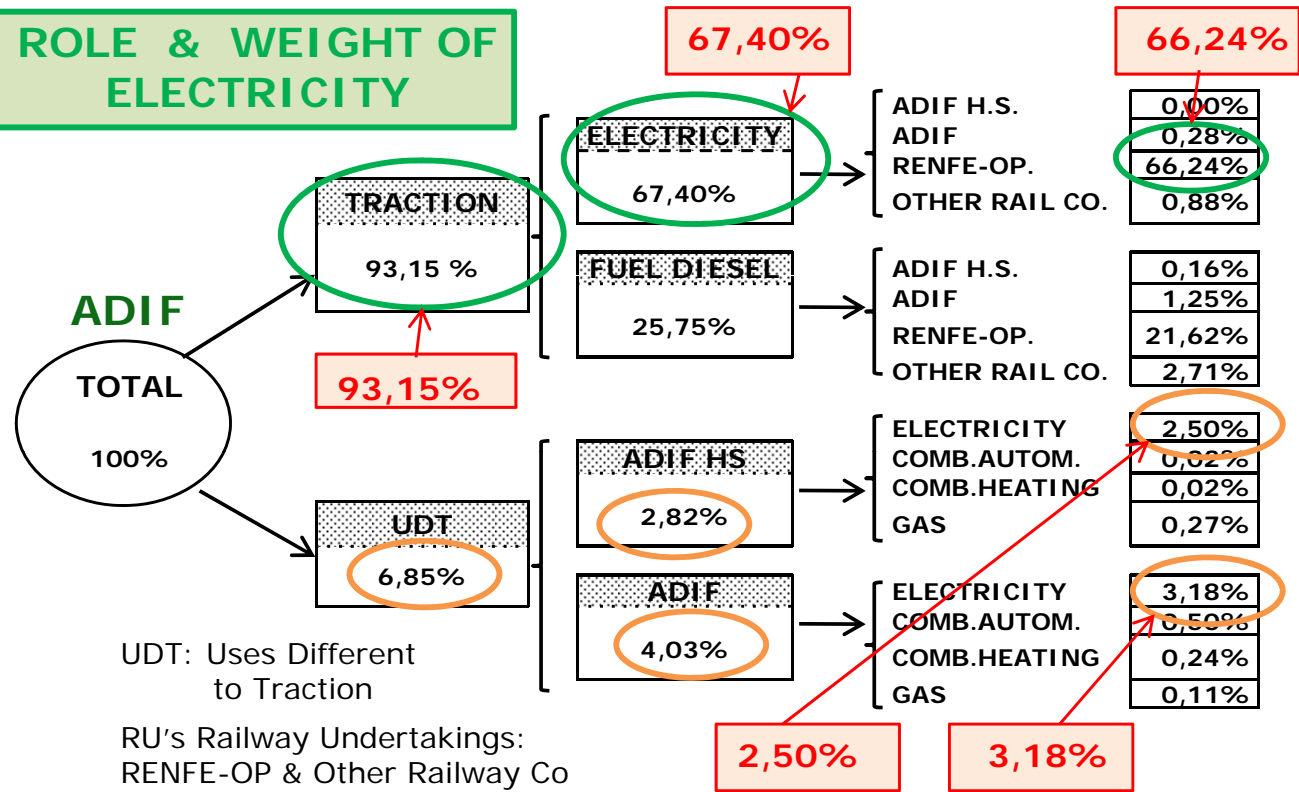

Acting over three Axes

- MANAGEMENT MEASURES      34 actions
- TECHNICAL MEASURES
- RENEWABLE ENERGY GENERATION SYSTEMS } 49 actions

Until July 2014, we have got savings of 17% for UDT energy consumption on ADIF & ADIF HS

### ROLE & WEIGHT OF ELECTRICITY

# MASTER PLAN FOR SAVINGS AND ENERGY EFFICIENCY 2014-2020

## OBJECTIVES MAP

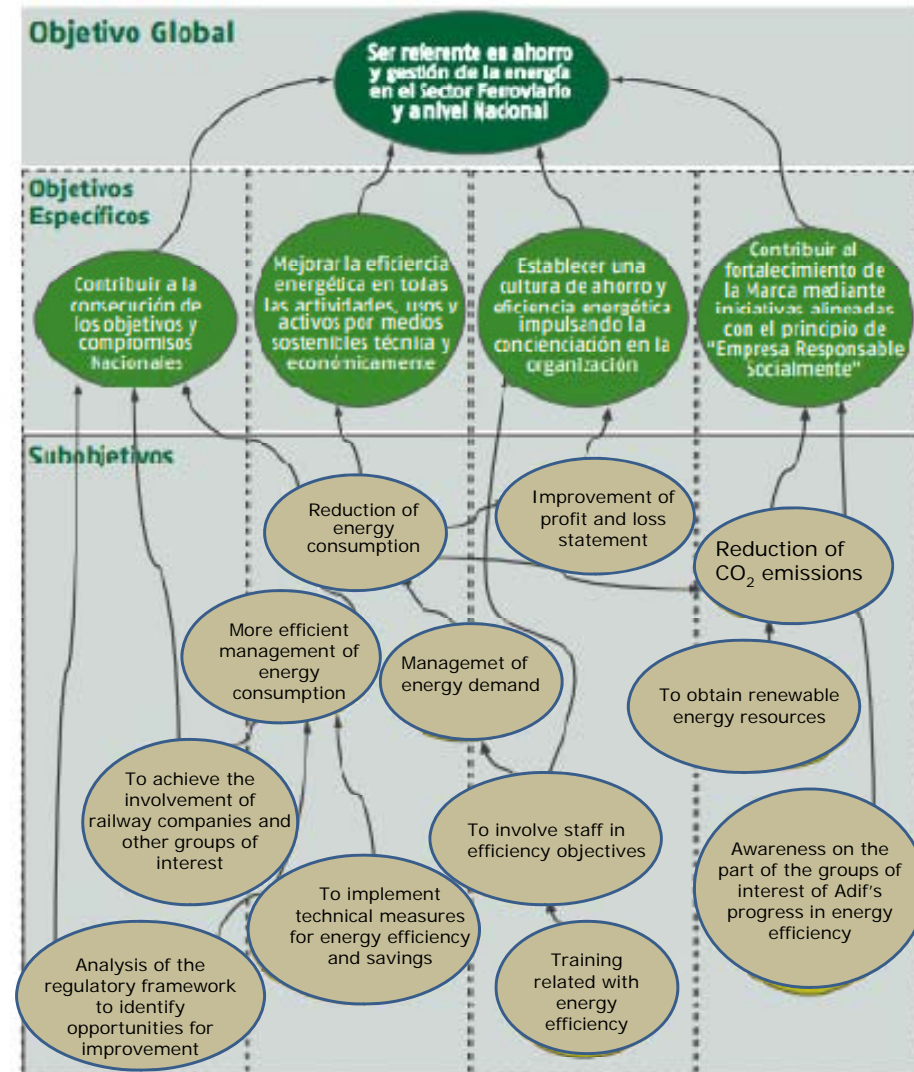

54. Plan Director de Ahorro y Efic. Energ. 2014-2020. Mapa de Objetivos

### GLOBAL OBJECTIVE:

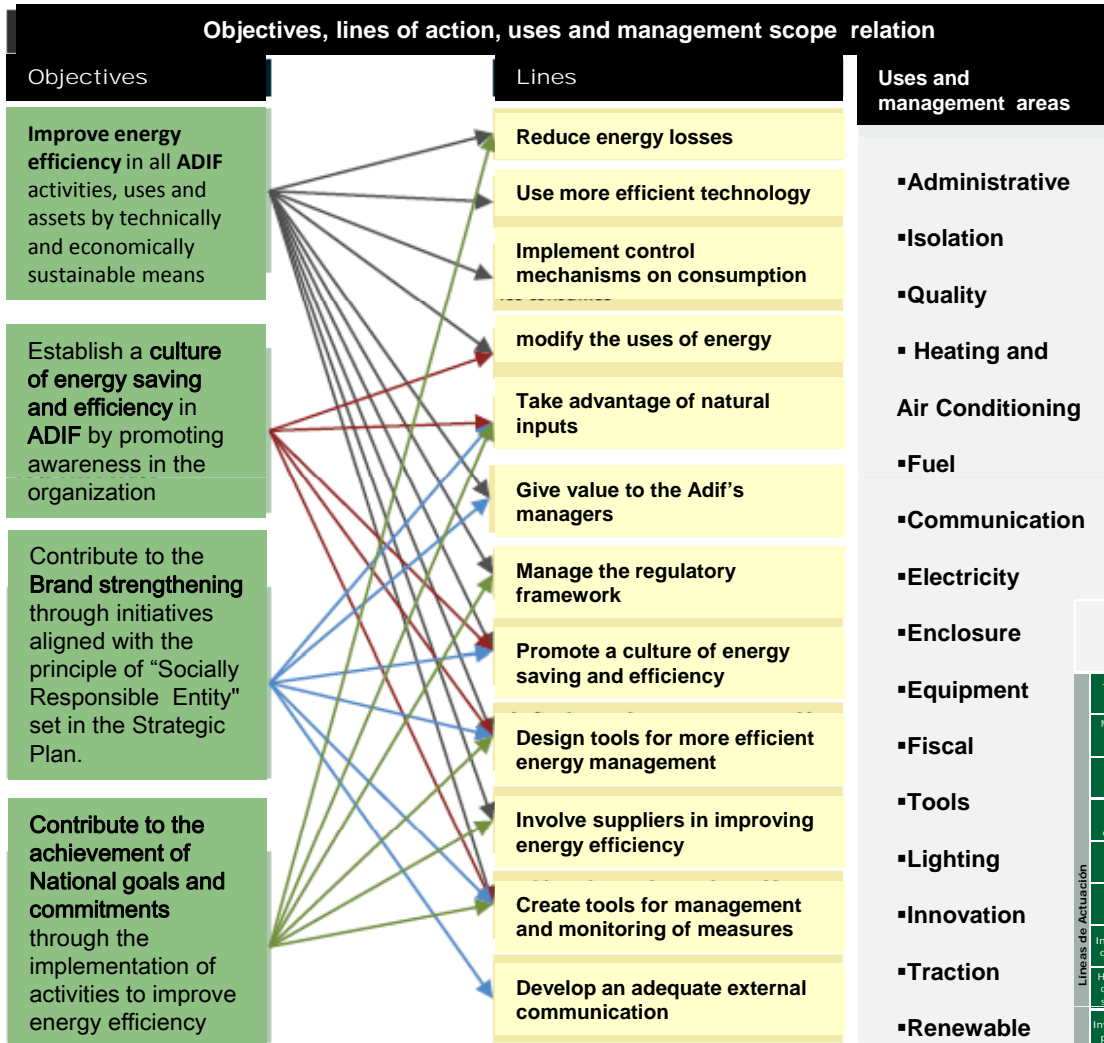

To be a reference in Energy management and savings in the Rail Sector and at national level

### SPECIFIC OBJECTIVES

- ✓ To contribute to the achievement of national objectives and commitments
- ✓ To improve energy efficiency in all activities, uses and assets through technical and environmentally sustainable means.
- ✓ To establish a savings and energy efficiency culture, promoting the awareness of the organisation.
- ✓ To contribute to the enhancement of the Brand through initiatives aligned with the principle: "Socially Responsible Company".

# RELATIONSHIP BETWEEN OBJECTIVES (4), ACTION LINES (12), USES AND MANAGEMENT AREAS (15)

| Lineas de Actuación                     | Objetivos  |                                     |   |                                     |

# MASTER PLANS: RESULTS AND MEDIUM TERM OBJECTIVES

Master Plan appraisal includes an evaluation of **cost and savings** (energy, CO<sub>2</sub> emissions) related to each one of the initiatives

Along the **2009-2016** period, we have got an **accumulated saving of 427,14 Gwh<sub>equiv</sub>** (with an economical value of **30.13 Mill €**) and **88,353 t CO<sub>2</sub>**, for an estimated cost of **10,03 Million €**

Current 2014-2020 Master Plan fixes an objective for **2020** of **163,69 Gwh<sub>equiv</sub>** (83% higher than 2014 result) for ADIF and ADIF AV together

| 2016         |                                   | Accum.2009-2016  |                                |
|--------------|-----------------------------------|------------------|--------------------------------|
| Cost         | Results on Savings                |                  |                                |
| 10,03 Mill € | 106,90 GWh <sub>equiv./year</sub> | 6,98 Mill €/year | 19.183 t CO <sub>2</sub> /year |
| 10,03 Mill € | 427,14 GWh <sub>equiv.</sub>      | 30,13 Mill €     | 88.353 t CO <sub>2</sub>       |

| Adif<br>25,34<br>Gwh <sub>eq</sub> /año    | 56,88 Gwh <sub>eq</sub> /año  |
| Adif AV<br>63,78<br>Gwh <sub>eq</sub> /año | 106,81 Gwh <sub>eq</sub> /año |

# SOME EXAMPLES OF FLYERS / ACTIONS RELATED WITH TRACTION

| DESARROLLAR MECANISMOS PARA LA MEDICIÓN Y FACTURACIÓN DE LOS CONSUMOS DE ENERGÍA ELÉCTRICA DE TRACCIÓN |   | TRAC-1  |
|--|---|---------|
|  |   | GESTIÓN |
| Objetivo del Plan Director   | Mejorar la eficiencia energética en todas las actividades, usos y activos de Adif por medios sostenibles técnica y económicamente. Contribuir a la consecución de los objetivos y compromisos Nacionales a través de la realización de acciones para la mejora de la eficiencia energética. |         |
| Línea del Plan Director  | Diseñar herramientas para una gestión más eficiente de la energía.  |         |
| Medida   | Diseñar e implementar un sistema de medida directa de los consumos de energía eléctrica utilizados por cada uno de los vehículos motores en la tracción de cada uno de los trenes.  |         |
| Justificación de la medida   | Mejorar el sistema de facturación de la energía de tracción, proporcionar información para la gestión.  |         |
| Organizaciones de Adif   | Área de Actividad de Telecomunicaciones y Energía.  |         |

## METERING AND BILLING TOOLS FOR TRACTION ENERGY CONSUMPTION

| DESARROLLAR HERRAMIENTAS PARA FACILITAR LA CONDUCCIÓN EFICIENTE |   | TRAC-2  |
|---|---|---------|
|   |   | GESTIÓN |
| Objetivo del Plan Director                                      | Mejorar la eficiencia energética en todas las actividades, usos y activos de Adif por medios sostenibles técnica y económicamente. Contribuir a la consecución de los objetivos y compromisos Nacionales a través de la realización de acciones para la mejora de la eficiencia energética. |         |
| Línea del Plan Director   | Teniendo en cuenta criterios de eficiencia energética.  |         |
| Medida  | Analizar el impacto de las limitaciones de velocidad actuales.  |         |
| Justificación de la medida                                      | El consumo de energía de tracción es el más importante en volumen, tanto eléctrico como combustible, por lo que el desarrollo de herramientas de gestión encaminadas a la mejora de la eficiencia en su uso habrá de resultar en ahorros significativos.                                    |         |
| Organizaciones de Adif  |   |         |

## TOOLS FOR EFFICIENT DRIVING

| PROYECTOS "FERROSMARTGRID" y "MERLIN" |   | INNO-6  |
|---------------------------------------|---|---------|
|                                       |   | GESTIÓN |
| Objetivo del Plan Director            | Mejorar la eficiencia energética en todas las actividades, usos y activos de Adif por medios sostenibles técnica y económicamente. Contribuir al fortalecimiento de la Marca mediante iniciativas alineadas con el principio de "Empresa Responsable Socialmente" establecido en el Plan Estratégico.   |         |
| Línea del Plan Director               | Emplear tecnologías más eficientes. Implantar mecanismos de control sobre los consumos. Aprovechar los aportes naturales. Poner en valor los activos de Adif.   |         |
| Medida                                | Migración de un sistema eléctrico ferroviario convencional a una red eléctrica inteligente, permitiendo optimizar el uso de la energía cinética y potencial de los trenes en el supuesto de la existencia de todos los dispositivos y dispositivos que permiten aprovecharla, tendiendo a crear dicha red inteligente (sistemas de tracción eficiente, interconexión de redes, acumuladores de tierra, generadores propios, consumos intermitentes y subestaciones reversibles que conectan con redes públicas inteligentes). Además se potencia la implantación de fuentes de energía renovables en diferentes puntos de la infraestructura, y que también tiene un carácter activa de esta red inteligente. |         |
| Justificación de la medida            | Analizar y ensayar la aplicabilidad del concepto de Red Eléctrica Inteligente sobre la red eléctrica ferroviaria de tracción.   |         |

| DISEÑO Y CONSTRUCCIÓN DE SUBESTACIONES EVOLUTIVAS |   | TRAC-7  |
|---|---|---------|
|   |   | GESTIÓN |
| Objetivo del Plan Director                        | Mejorar la eficiencia energética en todas las actividades, usos y activos de Adif por medios sostenibles técnica y económicamente. Contribuir a la consecución de los objetivos y compromisos Nacionales a través de la realización de acciones para la mejora de la eficiencia energética.   |         |
| Línea del Plan Director                           | Reducir pérdidas energéticas. Modificar los usos de la energía. Gestionar el marco normativo.   |         |
| Medida  | Desde la puesta en funcionamiento de una subestación hasta su explotación a plena carga por aumentos de tráfico o incorporación de distinto material rodante, la demanda de potencia es muy variable. Previendo que pueden darse estas situaciones de ampliación y/o refuerzo de potencia en subestaciones, en el diseño y posterior construcción de éstas pueden plantearse tres alternativas:<br>1. Diseñar las subestaciones para atender el tráfico inicial no previendo ampliaciones futuras. La inversión inicial y los costes de explotación y mantenimiento son menores, pero no obstante la necesidad de una nueva inversión en el futuro.<br>2. Diseñar las subestaciones para atender el tráfico futuro, no el inicial. Los costes de la factura eléctrica en la etapa inicial de explotación de la subestación son mucho mayores, debido al desajuste entre la potencia demandada y la instalada, la inversión inicial es mayor, los costes de explotación y mantenimiento son mayores debido a la mayor dimensión de las instalaciones, pero, en el futuro no se requerirá inversión para costear actuaciones de ampliación y/o refuerzo de potencia.<br>3. Diseñar las subestaciones para atender el tráfico futuro, no el inicial. Los costes de la factura eléctrica en la etapa inicial de explotación de la subestación son mucho mayores, debido al desajuste entre la potencia demandada y la instalada, la inversión inicial es mayor, los costes de explotación y mantenimiento son mayores debido a la mayor dimensión de las instalaciones, pero, en el futuro no se requerirá inversión para costear actuaciones de ampliación y/o refuerzo de potencia. |         |
| Justificación de la medida                        | La Orden FOM/3317/2010 establece: "Los estudios de dimensionamiento energético se realizarán considerando el tráfico real previsto en los diferentes escenarios de explotación. Se diseñarán las subestaciones eléctricas de tracción y sus centros de autotransformación, en su caso, para que sean evolutivas, y deberán proyectarse inicialmente de forma que se tenga de reserva para la primera fase".<br>Para cada subestación concreta, habrá de realizarse un estudio coste-beneficio que determine cuál de las tres opciones de diseño es la óptima considerando la inversión inicial, los costes de explotación y mantenimiento y la inversión para realizar la ampliación de potencia.   |         |
| Organizaciones de Adif                            | Área de actividad de Red Convencional.  |         |
| Alcance de aplicación:                            | Subestaciones de tracción.  |         |

## DESIGN AND CONSTRUCTION OF EVOLUTIVE SUBSTATIONS

| RECUPERACIÓN DE ENERGÍA DE FRENO REGENERATIVO EN LA RED CONVENCIONAL |   | TRAC-4  |
|--|---|---------|
|  |   | GESTIÓN |
| Objetivo del Plan Director   | Mejorar la eficiencia energética en todas las actividades, usos y activos de Adif por medios sostenibles técnica y económicamente. Contribuir a la consecución de los objetivos y compromisos Nacionales a través de la realización de acciones para la mejora de la eficiencia energética.   |         |
| Línea del Plan Director  | Modificar los usos de la energía. Reducir pérdidas energéticas. Gestionar el marco normativo. Poner en valor los activos de Adif.   |         |
| Medida   | Los trenes al utilizar el freno regenerativo transforman la energía cinética en eléctrica. De esta energía generada, el excedente que no pueda ser utilizado por otros trenes se disipará en las resistencias de freno del tren que la generó. Esta energía disipada en las resistencias de freno podría devolverse a la red eléctrica (Real Decreto 1011/2009), convirtiéndose las subestaciones de tracción actuales para las que el trasego de energía sólo puede realizarse desde la red eléctrica hacia la catenaria, en reversibles. Básicamente esta conversión consistiría en la instalación de un equipo convertidor C/CA conectado en paralelo, y del equipamiento de medida que permita el neteo de la energía entrante y la devuelta a la red. La energía que puede ser devuelta a la red eléctrica en una subestación reversible depende de muchas variables: tipo de trenes, densidad de tráfico, perfil de la línea, condiciones climáticas, esquema eléctrico de la línea, etc. De modo que antes de implementar esta medida, habrá de realizarse un análisis que determine, qué subestaciones presentan un mayor potencial de devolución a la red. La energía que se vierta a la red deberá ser conforme a lo exigido la norma EN 50160, "Características de la tensión suministrada por las redes generales de distribución", para ello será necesario realizar mediciones en subestaciones para evaluar: tasa de distorsión armónica, flicker, desequilibrio de tensiones, etc. Deberán realizarse las actuaciones pertinentes para que la energía devuelta al sistema eléctrico sea reconocida y neteada. Se ha realizado una experiencia de éxito en la red convencional, correspondiente a la subestación de la Comba, que ha permitido recuperar y devolver a la red eléctrica un 12,76% de la energía demandada en la línea Málaga-Fuengirola. Para futuras subestaciones es conveniente que, en el proyecto, sea reversible. |         |
| Justificación de la medida   | La explotación en el sistema ferroviario genera energía por la frenada en red eléctrica, como queda evidenciado en el caso de éxito de la subestación de la Comba.<br>Área de actividad de Red Convencional<br>Área de actividad de Innovación Tecnológica<br>Área de actividad de Telecomunicaciones y Energía   |         |

| 7.13 GWh        | 1.95 GWh | 27,3% |
| 0.457 Million € | 0.134 M€ | 29,3% |

### HS Services

## ➤ New rolling stock with energy efficiency criteria + Metering + Efficient ATO + Switch off of parked trains

Renfe is implementing an energy efficiency integrated Project to reduce overall consumption of traction uses

The Project includes the following actions:

- **Efficient Metering System** to replace in partnership with ADIF the current billing scheme based on Gross TKm by **billing based on real consumptions**
- **Efficient ATO** aiming fostering energy reductions of Eco-driving (average range **11-19%**, **máximum 31%**) of total energy consumption in some services and corridors
- **Switch off** auxiliary consumptions of parked trains (Eco-mode)

 200 m / 12 cars (3+8+1)  
 -43% operation cost per pax  
 13.83 kWh energy consumption  
 30,8 kW / ton Traction power  
 350 km/h

Talgo Avril awarded by Renfe

➤ **BUT, FROM A GENERAL AND FULLY INCLUSIVE POINT OF VIEW,  
IS HIGH SPEED A PROFITABLE DECISION?**  
*a very recent reflection by RENFE's General Director*

**But, What about costs?**

**AV operating costs are lower**

Speed not only doesn't increase operating costs, but reduces them

Attention, the costs necessary to move the train (operating c.) must be separated from the costs not related to movement.

## High Speed system financial results. Concept

Financial result (of the infra system+operation):

+ Revenue (from transport)–

- Variable operating costs (energy, material maintenance, train staff, on-board and track-side service, distribution costs,...)
- **Fixed capital costs of the operation (repayment and financial depreciation of rolling stock and the sales system)**
- Variable costs of exploiting the infra. (spreading, contact wire wear, etc.)
- **Fixed operating costs of the infrastructure (line surveillance, instantaneous safety monitoring, fixed part of the track, etc.)**
- **Fixed capital costs of the infrastructure (amortization and financial costs of the line).**

Cost per unit bid  
(c€/place. km)

Cost per traffic unit  
(c€/v.kmort)

Alberto García Alvarez / Ciudad real/Sevilla, october 5, 2017

There is no clear relationship between the maintenance costs of a high-speed and a conventional line.

ADIF's yearly Revenues

Traction Power System (TPS) used in Spanish High Speed network

Energy consumption of High Speed trains. Case of Spain

Eco Driving

Smart Grid

New AC substation concept

Conclusions

# Traction Power System (TPS) used in Spanish High Speed network

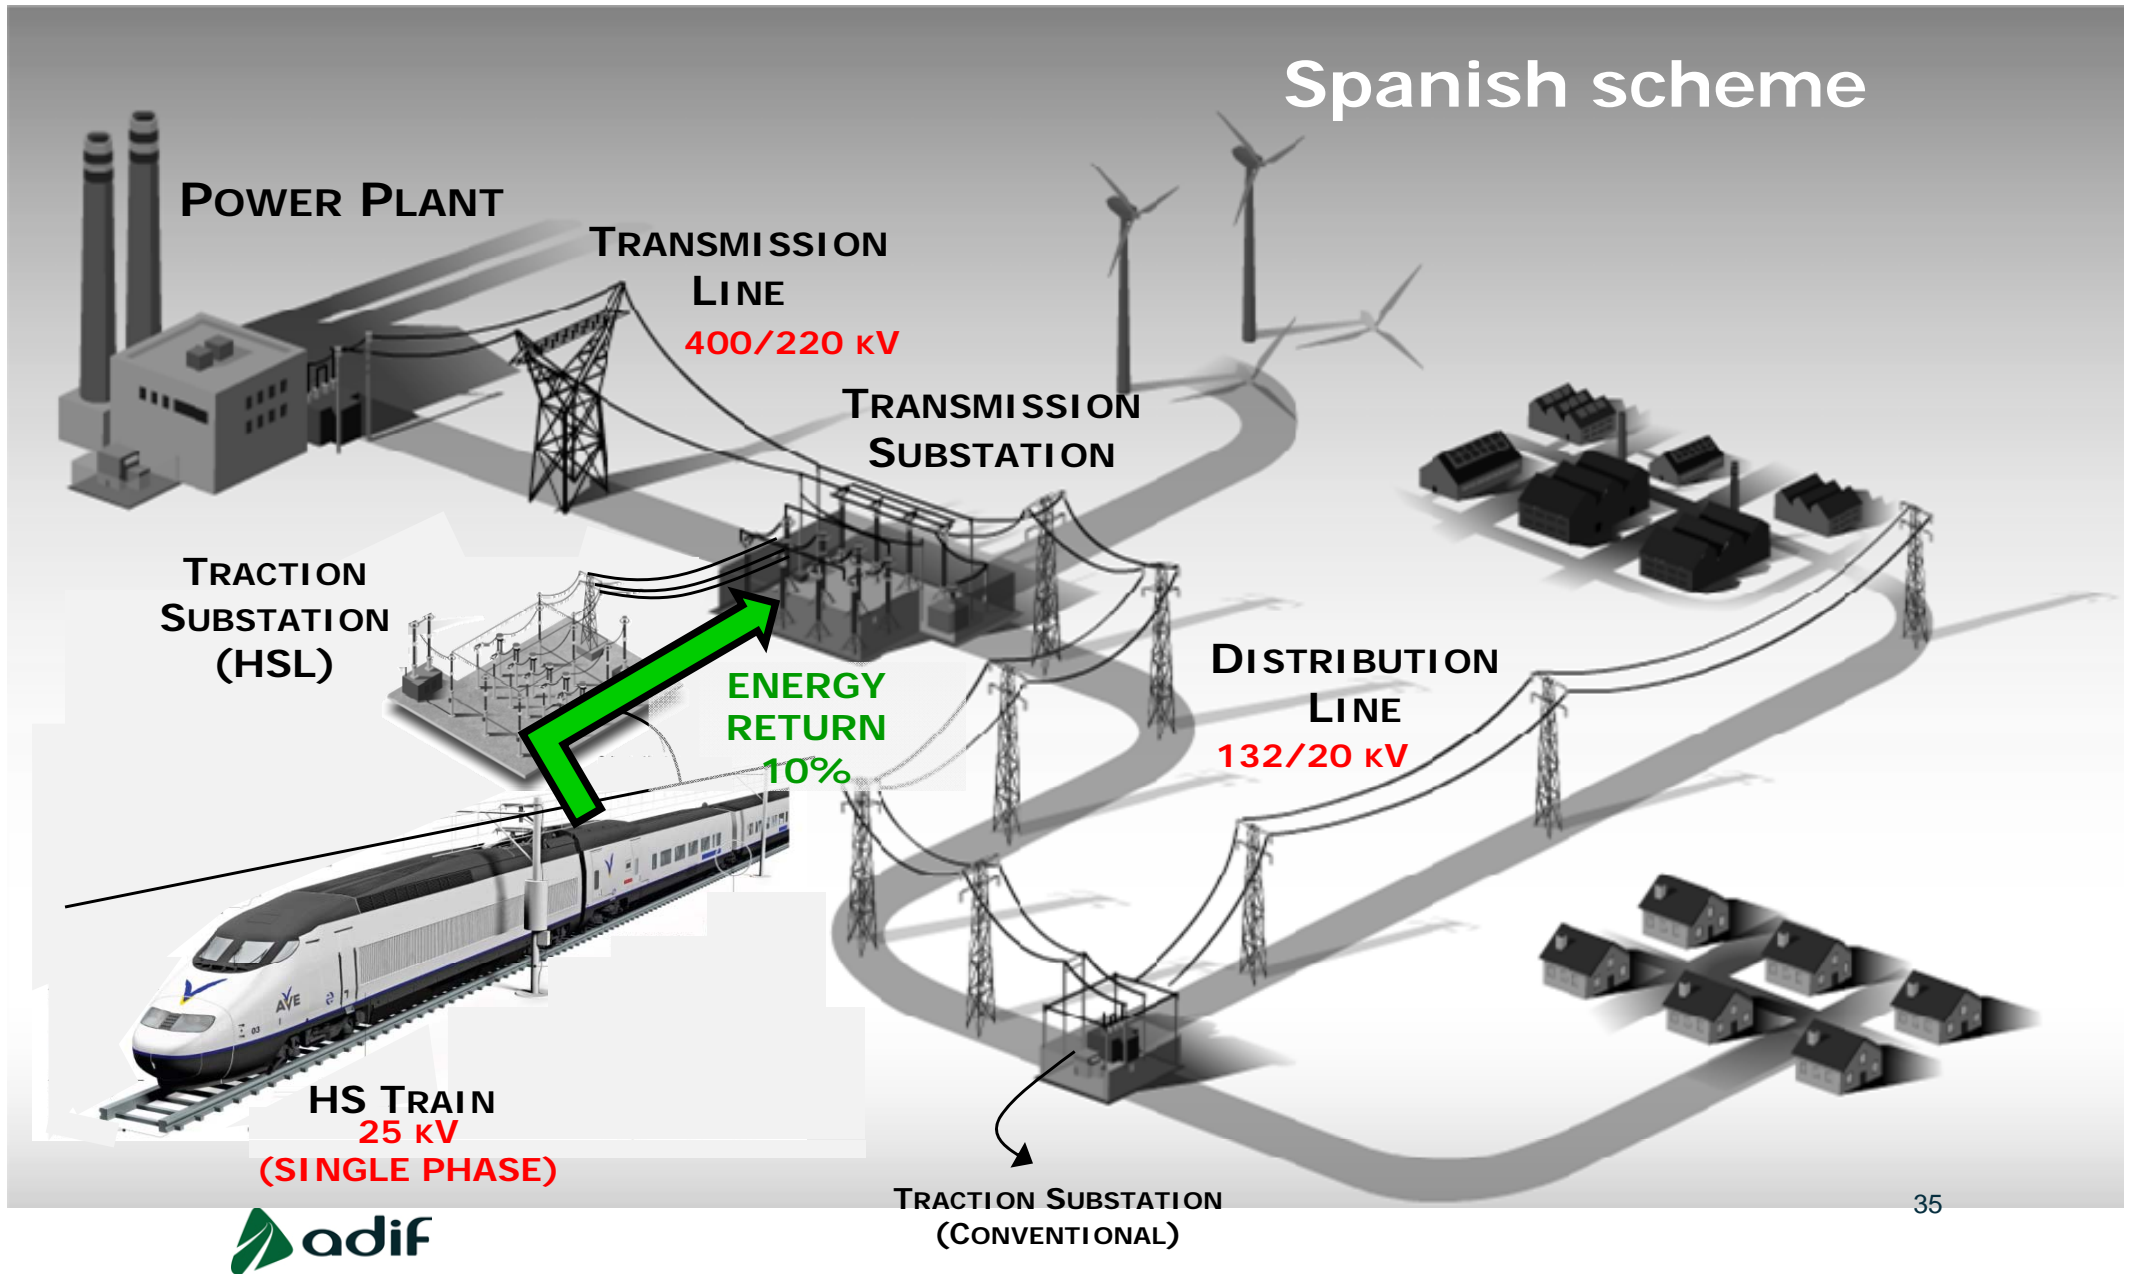

## Traction Power System (TPS) used in Spanish High Speed network

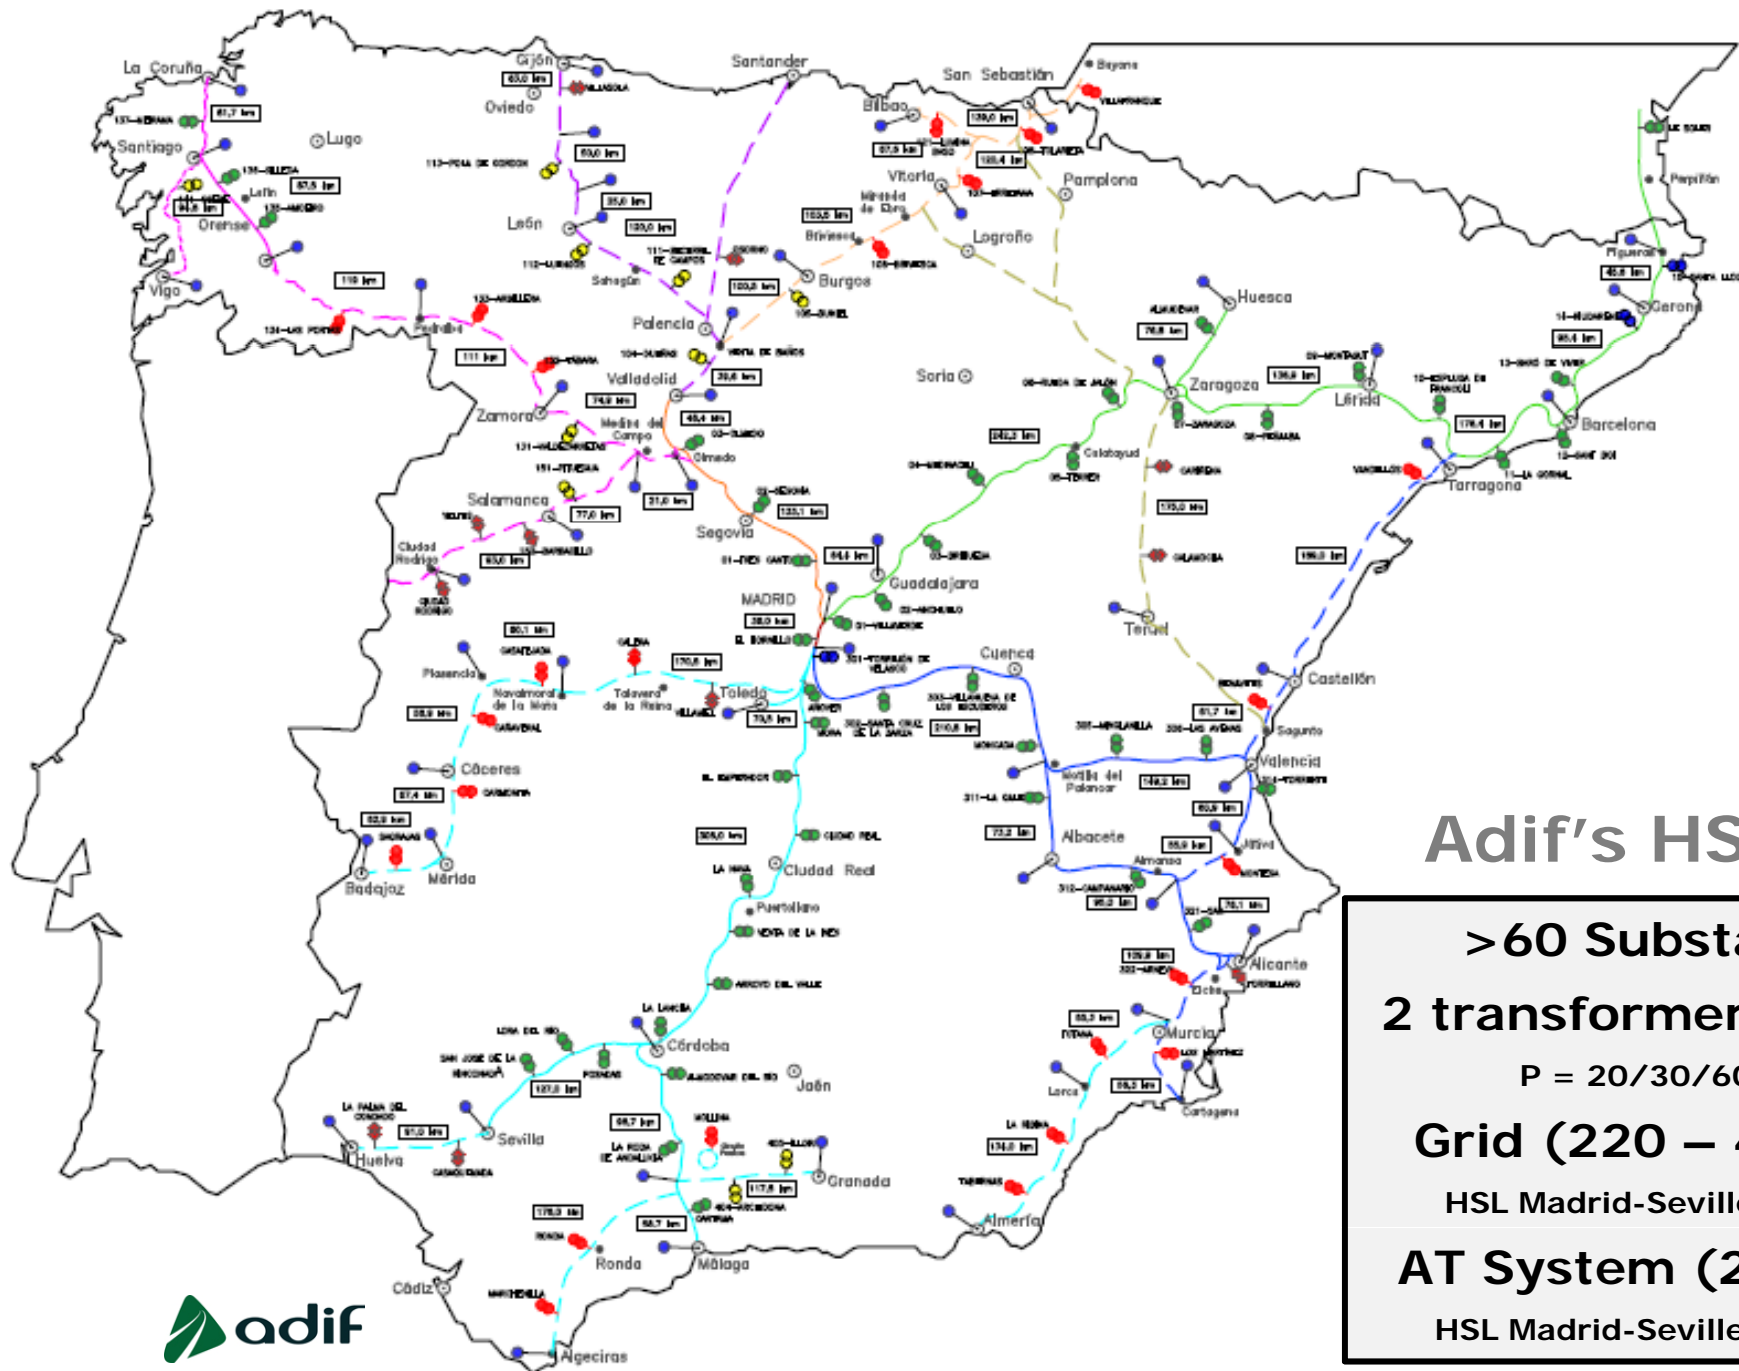

### Four general characteristics:

1. **High power demanded**  $\Rightarrow$  Grid with high short-circuit power (In Spain: Grid = Transport Line).
2. **AC system** (single-phase): *25 kV, 50 Hz.*
3. **Very efficient system** (infrastructure & rolling stock):  
*e.g. Electric power regenerated.*
4. **Source of disturbances.**

# Traction Power System (TPS) used in Spanish High Speed network

# Traction Power System (TPS) used in Spanish High Speed network

## Adif's HS TPS

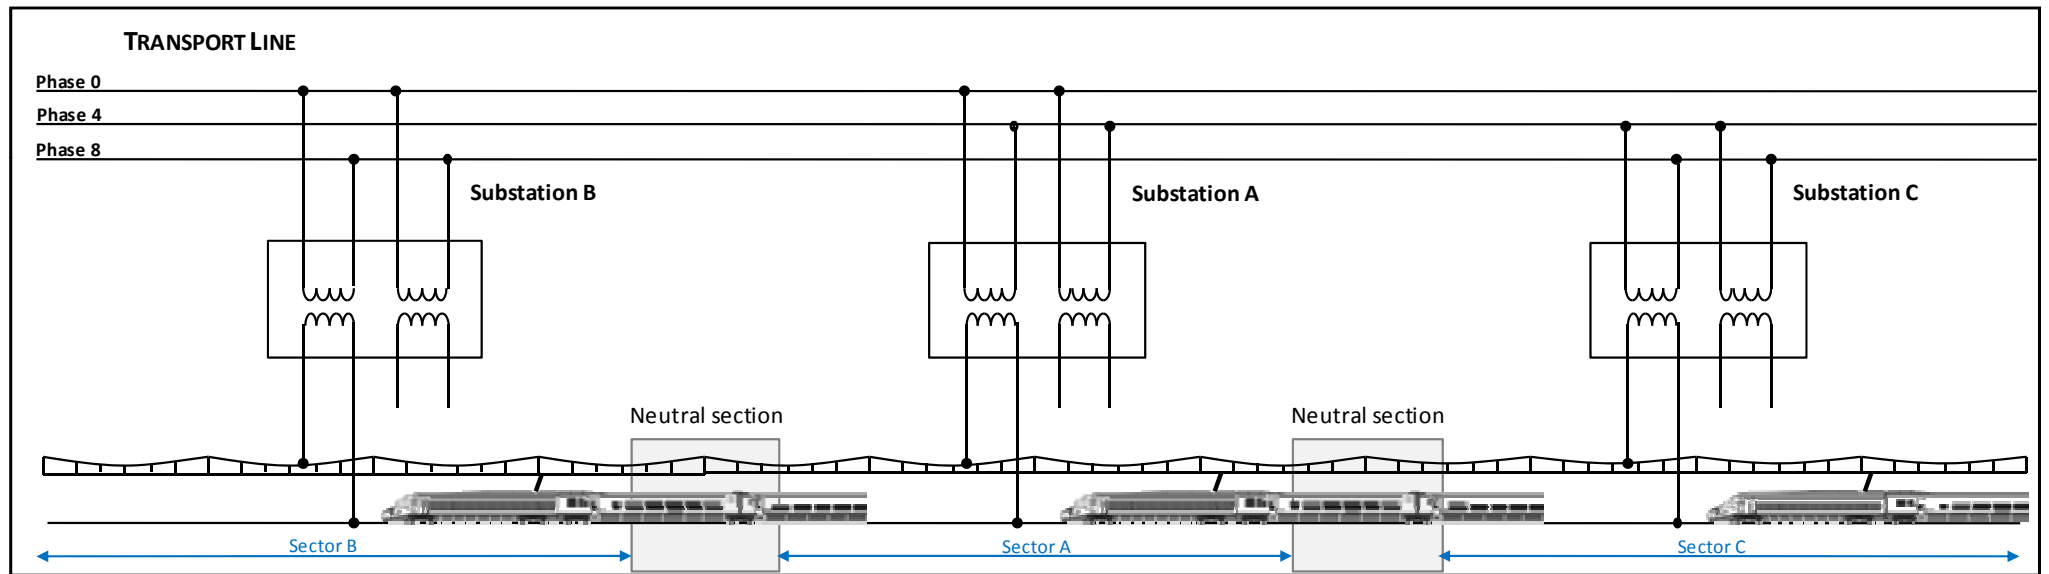

- >60 Substations
- 2 transformers (2 x P)  
P = 20/30/60 MVA
- Grid (220 – 400 kV)
- HSL Madrid-Seville (132 kV)
- AT System (2x25 kV)
- HSL Madrid-Seville (1x25 kV)

CATENARY CONNECTION: 1x25 kV & 2x25 kV

25 kV / 0 / -25 kV

## Traction Power System (TPS) used in Spanish High Speed network

CATENARY CONNECTION: 1x25 kV & 2x25 kV

Auto Transformer

## Traction Power System (TPS) used in Spanish High Speed network

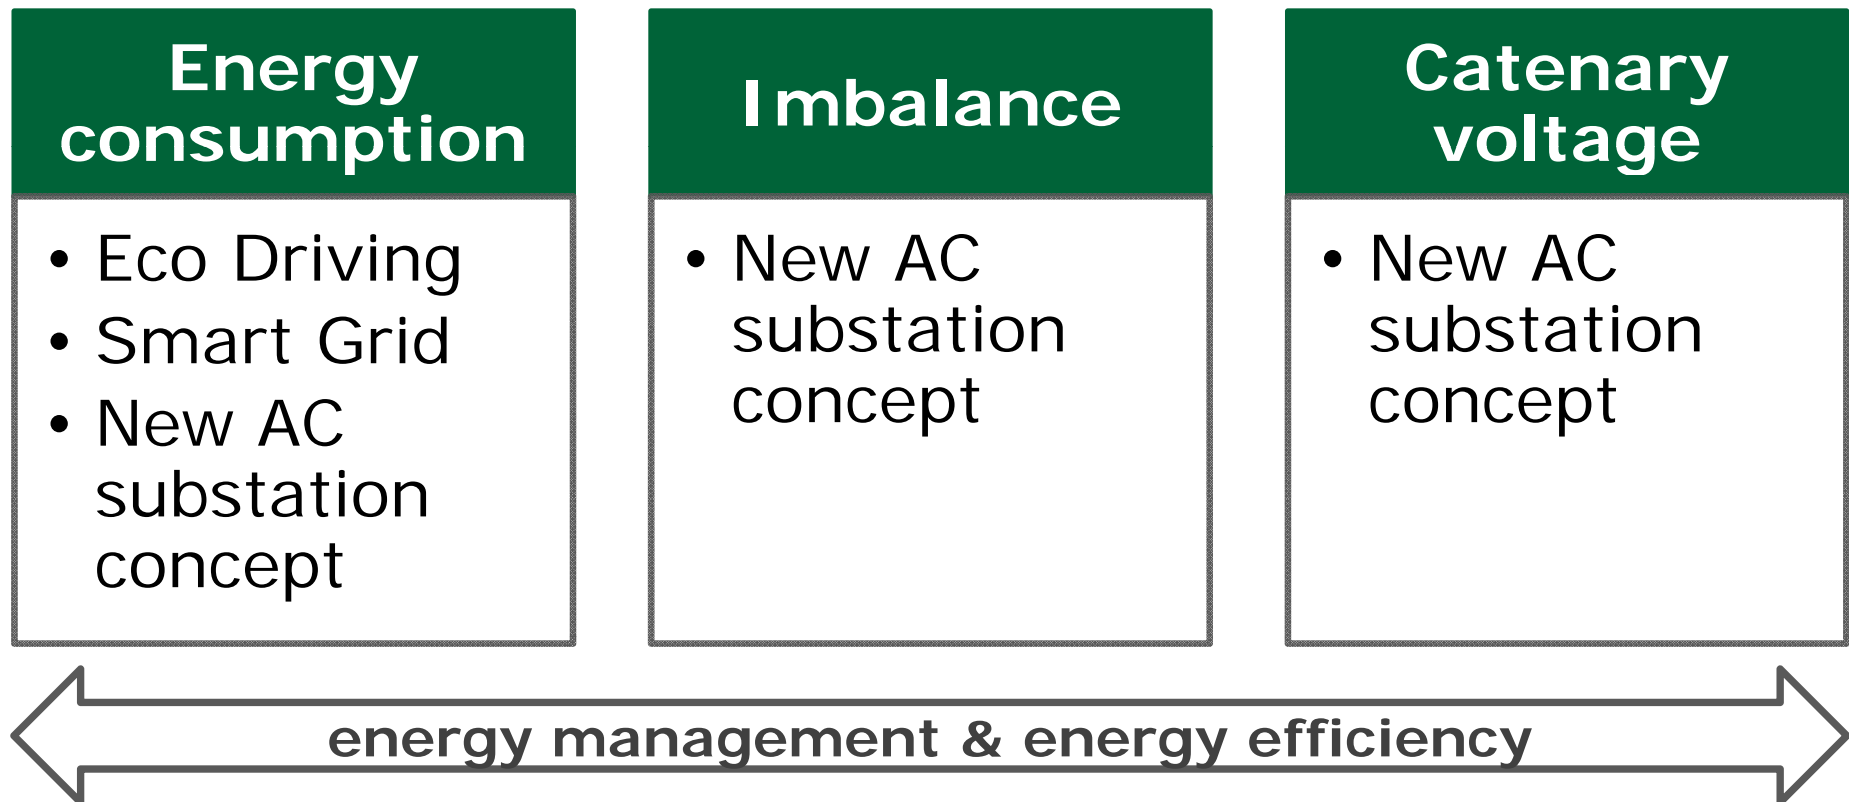

Our approach: A sustainable TPS must optimize mainly the following three variables:

1. Energy consumption.
2. Grid imbalance.
3. Catenary voltage.

**The incorporation of technologies (existing and new) is done analyzing these three variables**

## Traction Power System (TPS) used in Spanish High Speed network

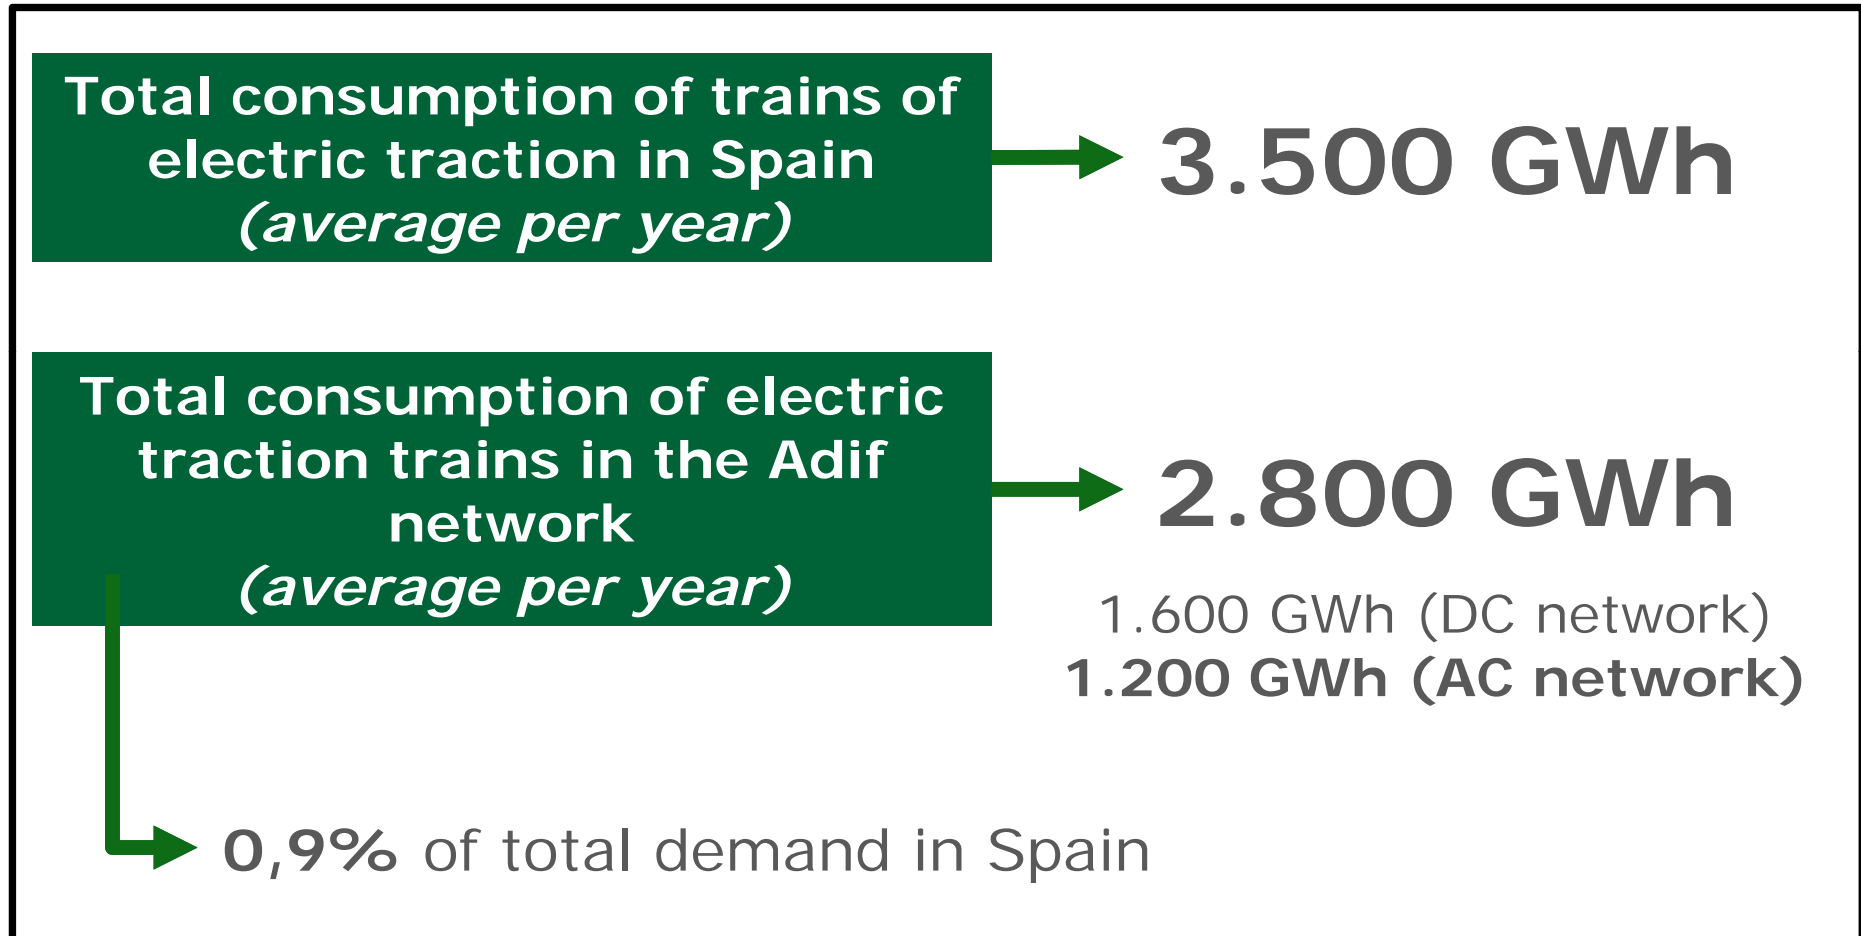

Adif is developing different lines of work and technologies oriented to the efficiency of the TPS:

**Energy consumption  
of High Speed trains.  
Case of Spain**

## Energy consumption of High Speed trains. Case of Spain

# Energy consumption of High Speed trains. Case of Spain

## Two conclusions:

- The **energy consumption of HS trains** (per passenger) could be **similar to than in slower trains running between the same stations**, as a consequence of acceleration/braking processes. Main factor will be the degree of occupation of different trains, that in Spain is much higher for HS (around 90%) that for conventional trains (we will simulate for Thane-Nasik section, on Chapter 4, adapted to Indian conditions, with an high degree of occupation of Conventional Trains)
- The **energy consumption in HS trains is also the lowest of all the means of transport**. With the increase of their speed, passengers prefer HS trains to, for example, planes. The energy consumption and carbon emissions are lower with the HS trains (of course, with a big density of traffic) (we also will apply to Indian case on Chapter 4)

# Energy consumption of High Speed trains. Case of Spain

Comparative between different types of trains

# Energy consumption of High Speed trains. Case of Spain

Comparative between different modes/different cities/different degrees of occupation

# Energy consumption of High Speed trains. Case of Spain

## Some of the reasons of the efficiency:

- More homogeneous speed profile (*less speed variation*).
- Less distance (-23%).
- Lower ancillary services consumption (*less travel time*).
- Less mass per seat and smoother trains.
- More efficient aerodynamic profile.
- Bigger trains.
- Better load factor.
- More efficient TPS.

# Energy consumption of High Speed trains. Case of Spain

Some of the reasons of the efficiency:

## More efficient TPS

# Eco Driving

# Eco Driving

- In the case of a HSL is the initial action to be used.
- Consists of consuming the minimum possible energy respecting the commercial time of the train.
- Putting it into practice, **the energy consumed can be reduced by around 20%** (our experience).
- It does not mean in principle a great economic investment.
- Pre-simulation process and subsequent application in service (1: Optimum manual driving; 2: ATO integration).

# Eco Driving

## Madrid-Seville HSL (example)

By applying a Eco Driving, it is possible, respecting the commercial timetable of the train, to travel approximately to 60% of the Madrid-Seville route in drift, and 50% in the return (since in this case the ramp proportion is greater, having to climb from the valley of the *Guadalquivir River* to the *Plateau of Castilla*)

⇒ **23% less energy.**

# Smart Grid

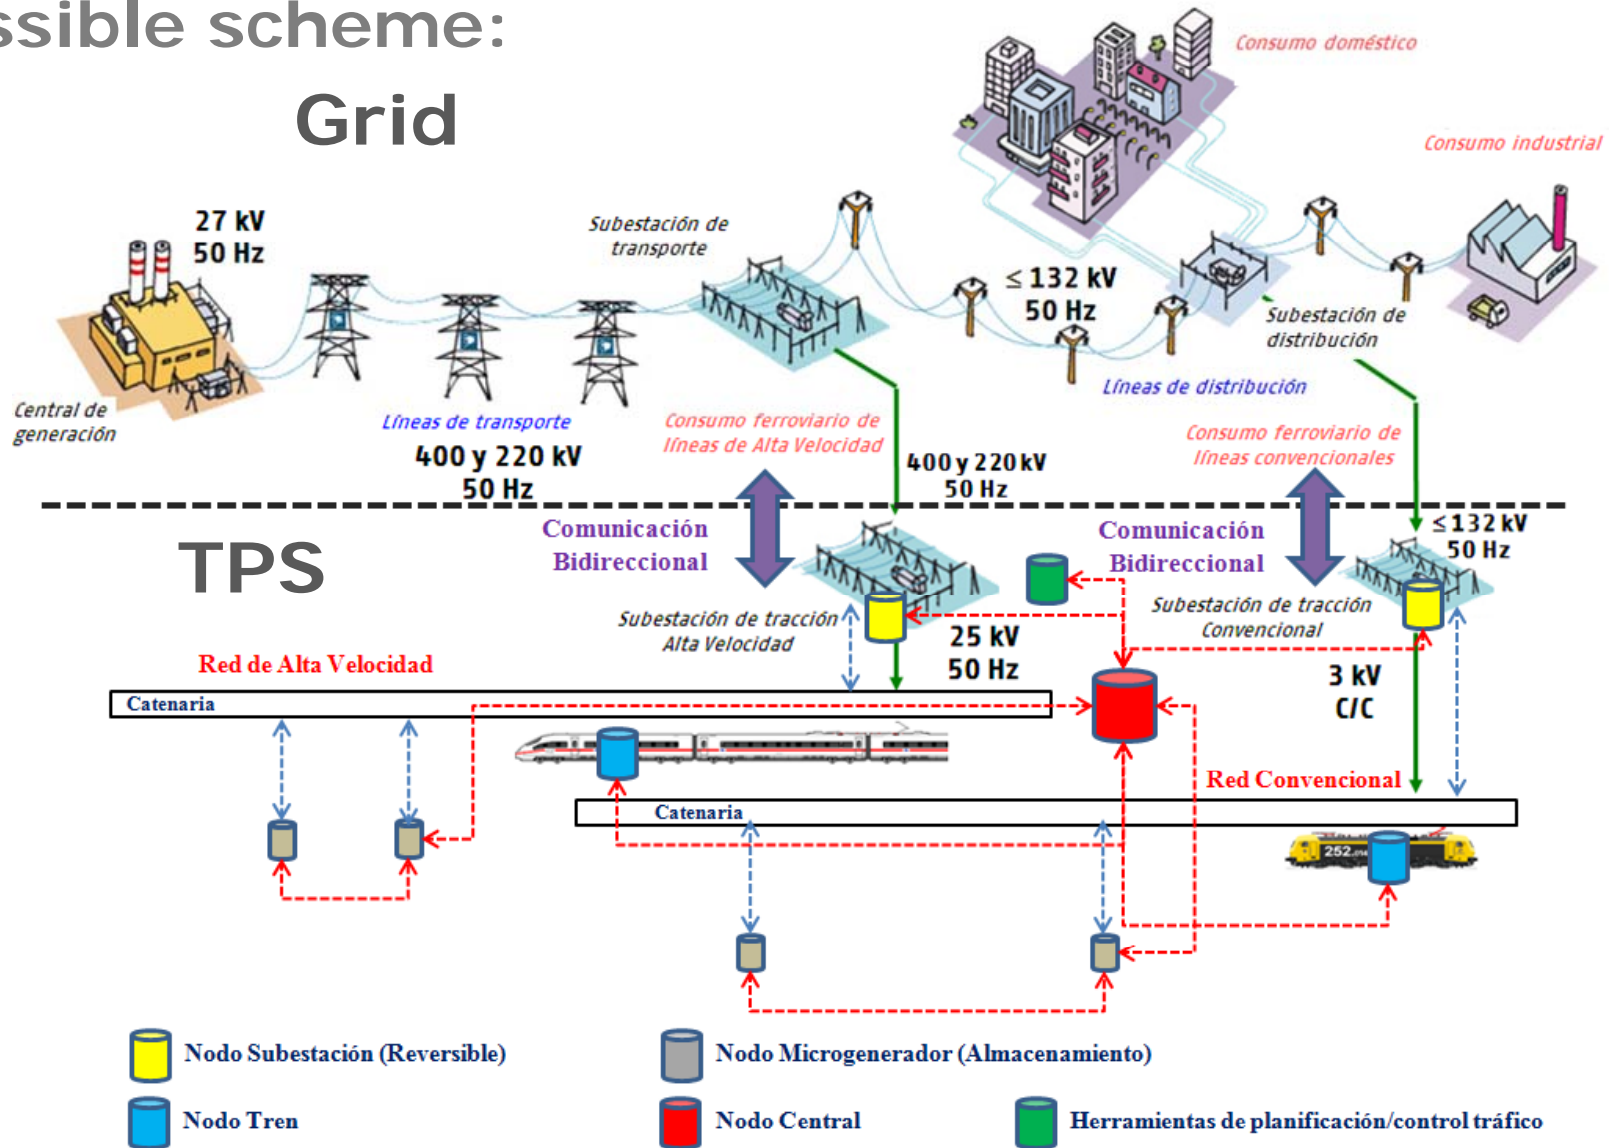

# Smart Grid

- A **Smart Grid** network is one that can efficiently integrate the behavior and actions of all users connected to it, so as to ensure a sustainable and efficient energy system with low losses and high levels of quality and security of supply, making intensive use of information technologies and telecommunications.
- Measure of application in High Speed TPS.
- Introduction of **new concepts**: *e.g. distributed generation (e.g. renewable energy), Smart Metering, Storage, etc.*
- Important issue: **Vehicle-infrastructure interaction from an energy consumption point of view.**
- **Reductions in energy consumption of around 10%.**

# Smart Grid

## Possible scheme: Grid

# Smart Grid

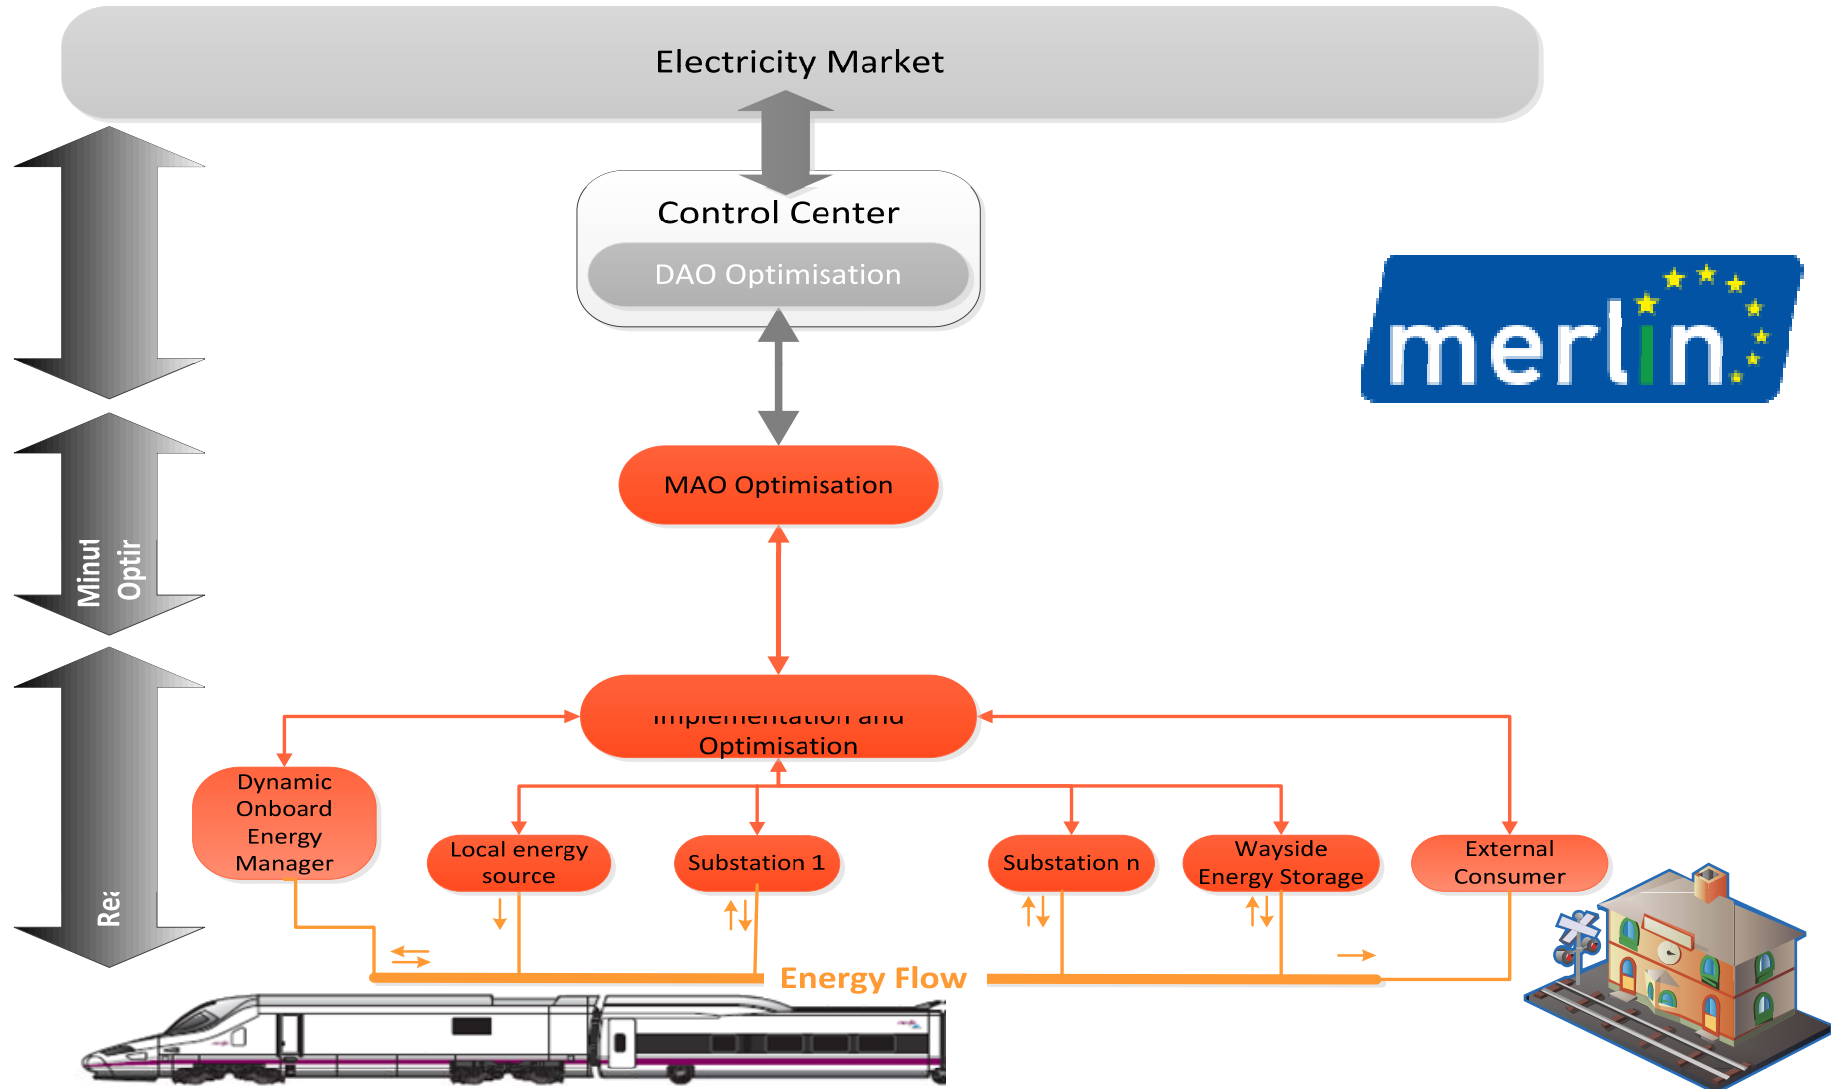

Some internal tests:

## Cordoba-Malaga HSL

# Smart Grid

## Merlin Vision:

# New AC substation concept

## New AC substation concept

- A new concept of traction substation for High Speed lines is being developed. Although the reduction of **energy consumption is an objective (around 8%)**, this substation has other advantages directly related to the efficiency of the TPS.
- Specifically, the new substation will optimize the **imbalance** problems in those lines connected to moderate short-circuit power networks (considering a high traffic density). It is also planned to regulate the **voltage of the catenary** according to the operational needs, always optimizing the losses.
- It is not a viable solution for new High Speed lines (already in operation) because problems do not occur.
- On the other hand, Adif wants to develop this solution for old HSL where power requirements are important and operating problems can occur if traffic increases. It is also an applicable solution for the transformation of a DC line to an AC line (connection to distribution network with low short-circuit power).

## New AC substation concept

### Power Electronics as countermeasure (active methods)

| Power Supply         | Converter Power Rating (Per-Unit Load) | Neutral Sections | Catenary Voltage and Frequency Regulation | Harmonic Compensation | Catenary Short Circuit Protection |

| COPHASE SUPPLY       | 0.5                                    | Can be omitted   | No  | Yes                   | Passive                           |

# New AC substation concept

## Madrid-Seville HSL: New analyses

- Future scenario: Greater power demanded (*e.g. increased traffic (more trains) and trains in double composition*).
- Use of the existing grid and TPS (equipment and configuration).
- In this situation, the operation of this future scenario would become impracticable (greater grid imbalance, excessive voltage drop in catenary, etc.), mainly in a degraded operating situation.
- Need to use a new technical solution: *full-power converter*.

# Conclusions

# Conclusions

- If we consider the **energy efficiency of the HS system**, we do not just have to take into account the direct energy consumption. An efficient line is also one that does not produce affections about the environment. It is also that line that safely and optimally supplies the energy demanded by the train.
- **Three variables for analysis:** *Energy consumption, imbalance and voltage in catenary* (drop voltage).
- The incorporation of technologies (existing and new ones) is done analyzing these three variables. **Eco Driving, Smart Grid** and **New AC substation** are the main technologies in which Adif works now.
- In any case **in Spain the energy consumption of HS trains (per passenger) is usually lower than in slower trains** running between the same stations. The energy consumption in HS trains is also the lowest of all the means of transport.
- Some of the reasons of the efficiency: More homogeneous speed profile, less distance, lower ancillary services consumption and more efficient electric system.

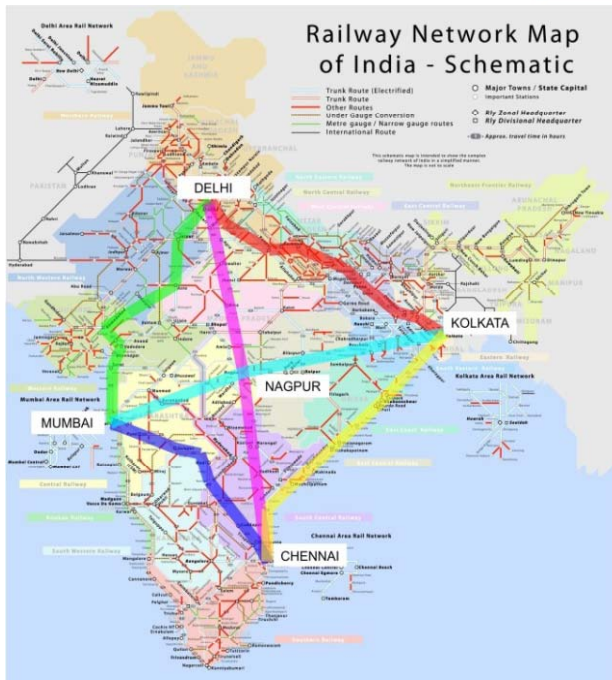

## Conclusions (2)

- **Eco Driving:** In the case of a HSL is the initial action to be used. Putting it into practice, the energy consumed can be reduced by around **20%** (our experience).
- **Smart Grid:** Measure of application in HSL. Reductions in energy consumption of around **10%**. Introduction of new concepts: e.g. distributed generation (e.g. renewable energy), Smart Metering, Storage, etc.
- **Smart Grid:** Vehicle-infrastructure interaction from an energy consumption point of view.
- **New AC substation** (with full-power converters): Although the reduction of energy consumption is an objective (**around 8%**), this substation has other advantages directly related to the efficiency of the TPS. Specifically, the new substation will optimize the imbalance problems in those lines connected to moderate short-circuit power networks (considering a high traffic density). It is also planned to regulate the tension of the catenary according to the operational needs, always optimizing the losses.

(feasibility study of New HSL Mumbai-Kolkata / phase 1: Mumbai-Nagpur)**

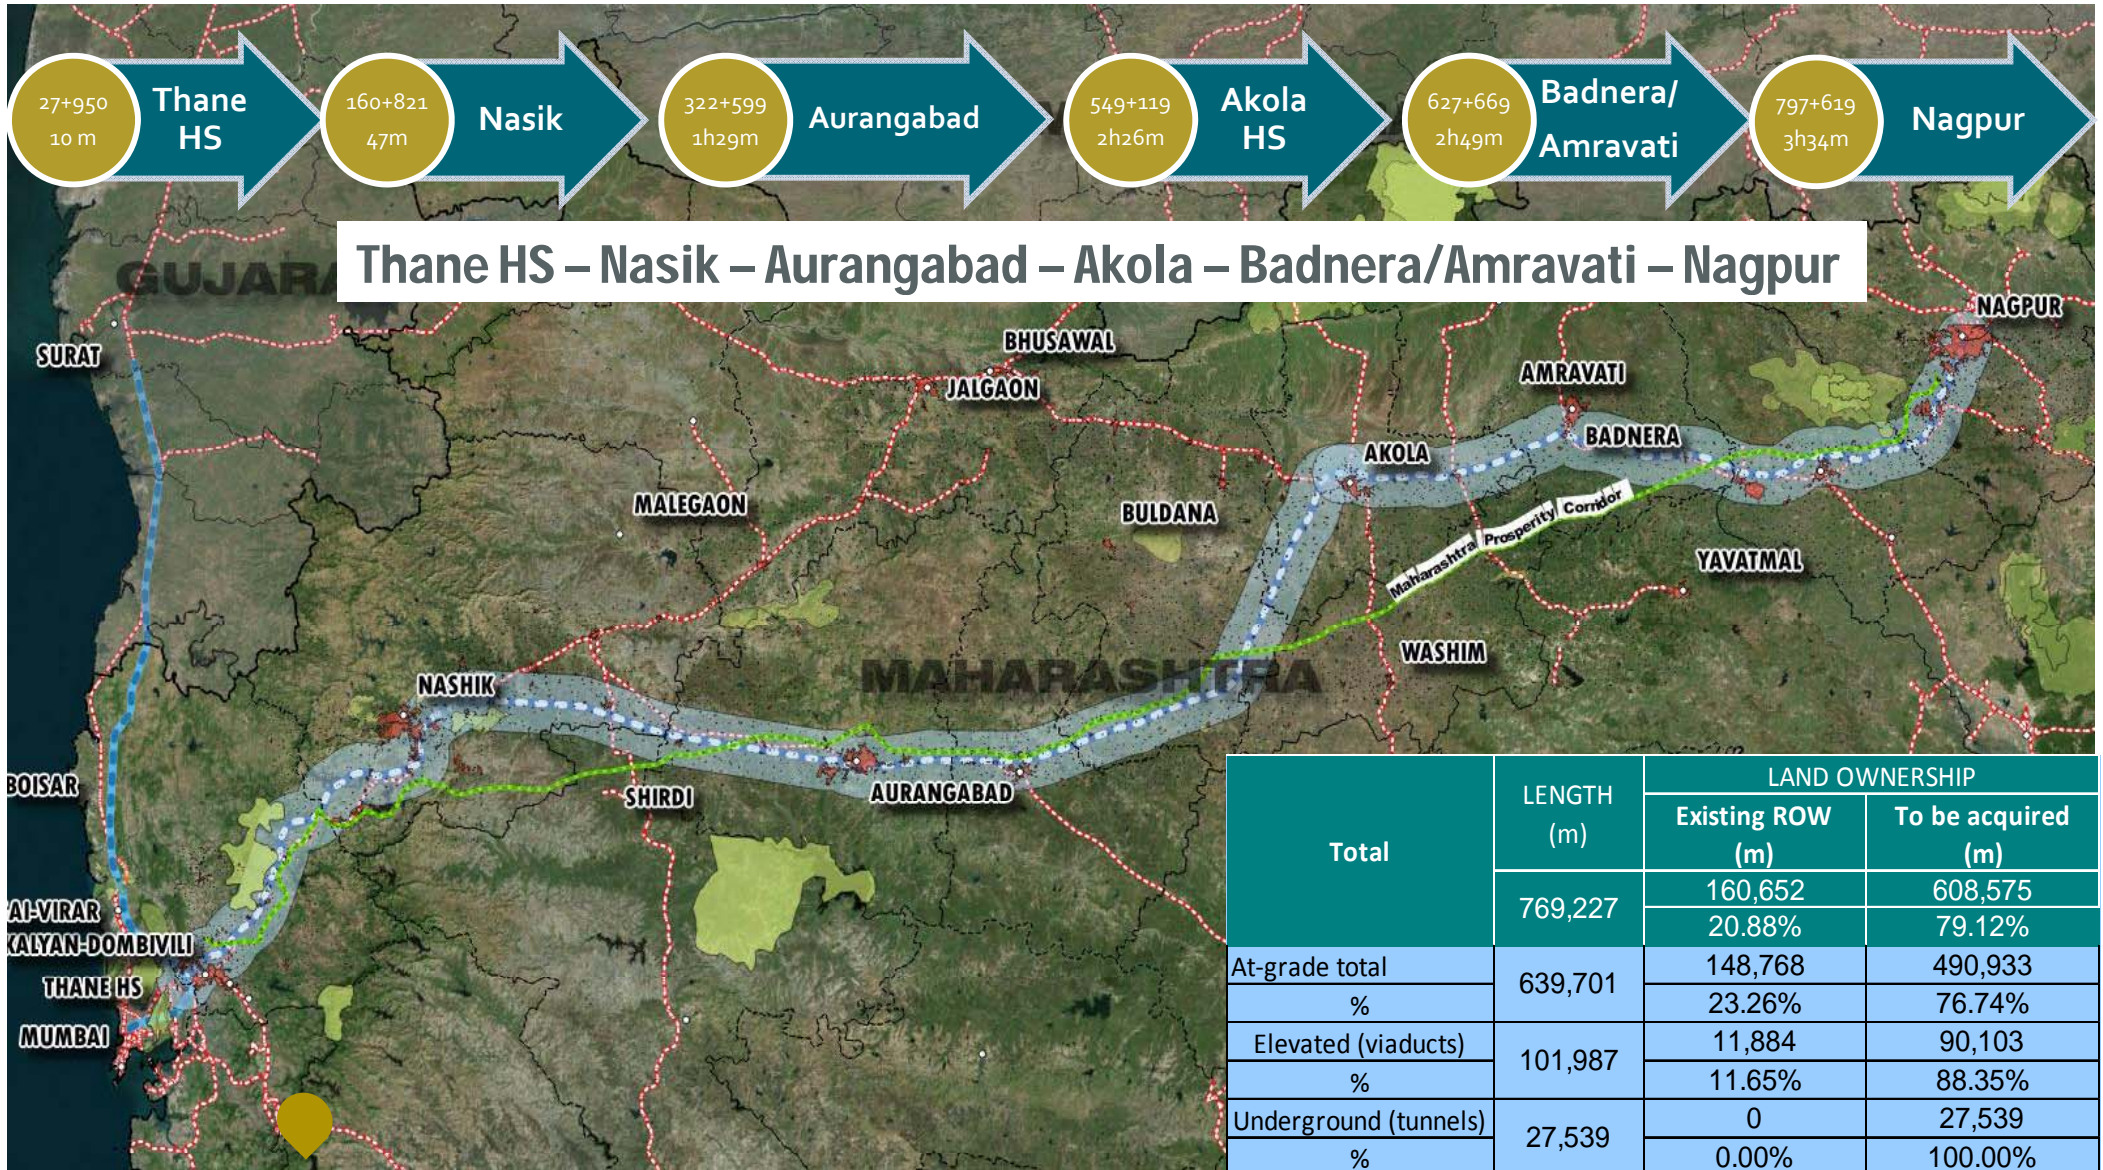

Feasibility Study for a future High Speed Rail (HSR) between MUMBAI and KOLKATA (PHASE I Mumbai - Nagpur). Its main objective is to evaluate if the project is feasible, minimizing all technological risks link to a HSR project, reaching the best cost effectiveness and studying all the financing requirements. As main reference for this Feasibility Study it has been considered the Spanish proven technology on High Speed Lines, adapted to India's specific conditions

- Collaboration Agreement signed by HSRC and ADIF
- ToR agreed by HSRC with ADIF
- G2G support by Spanish Ministry of Economy and Competitiveness

(\*) Journey Time from Mumbai BKC

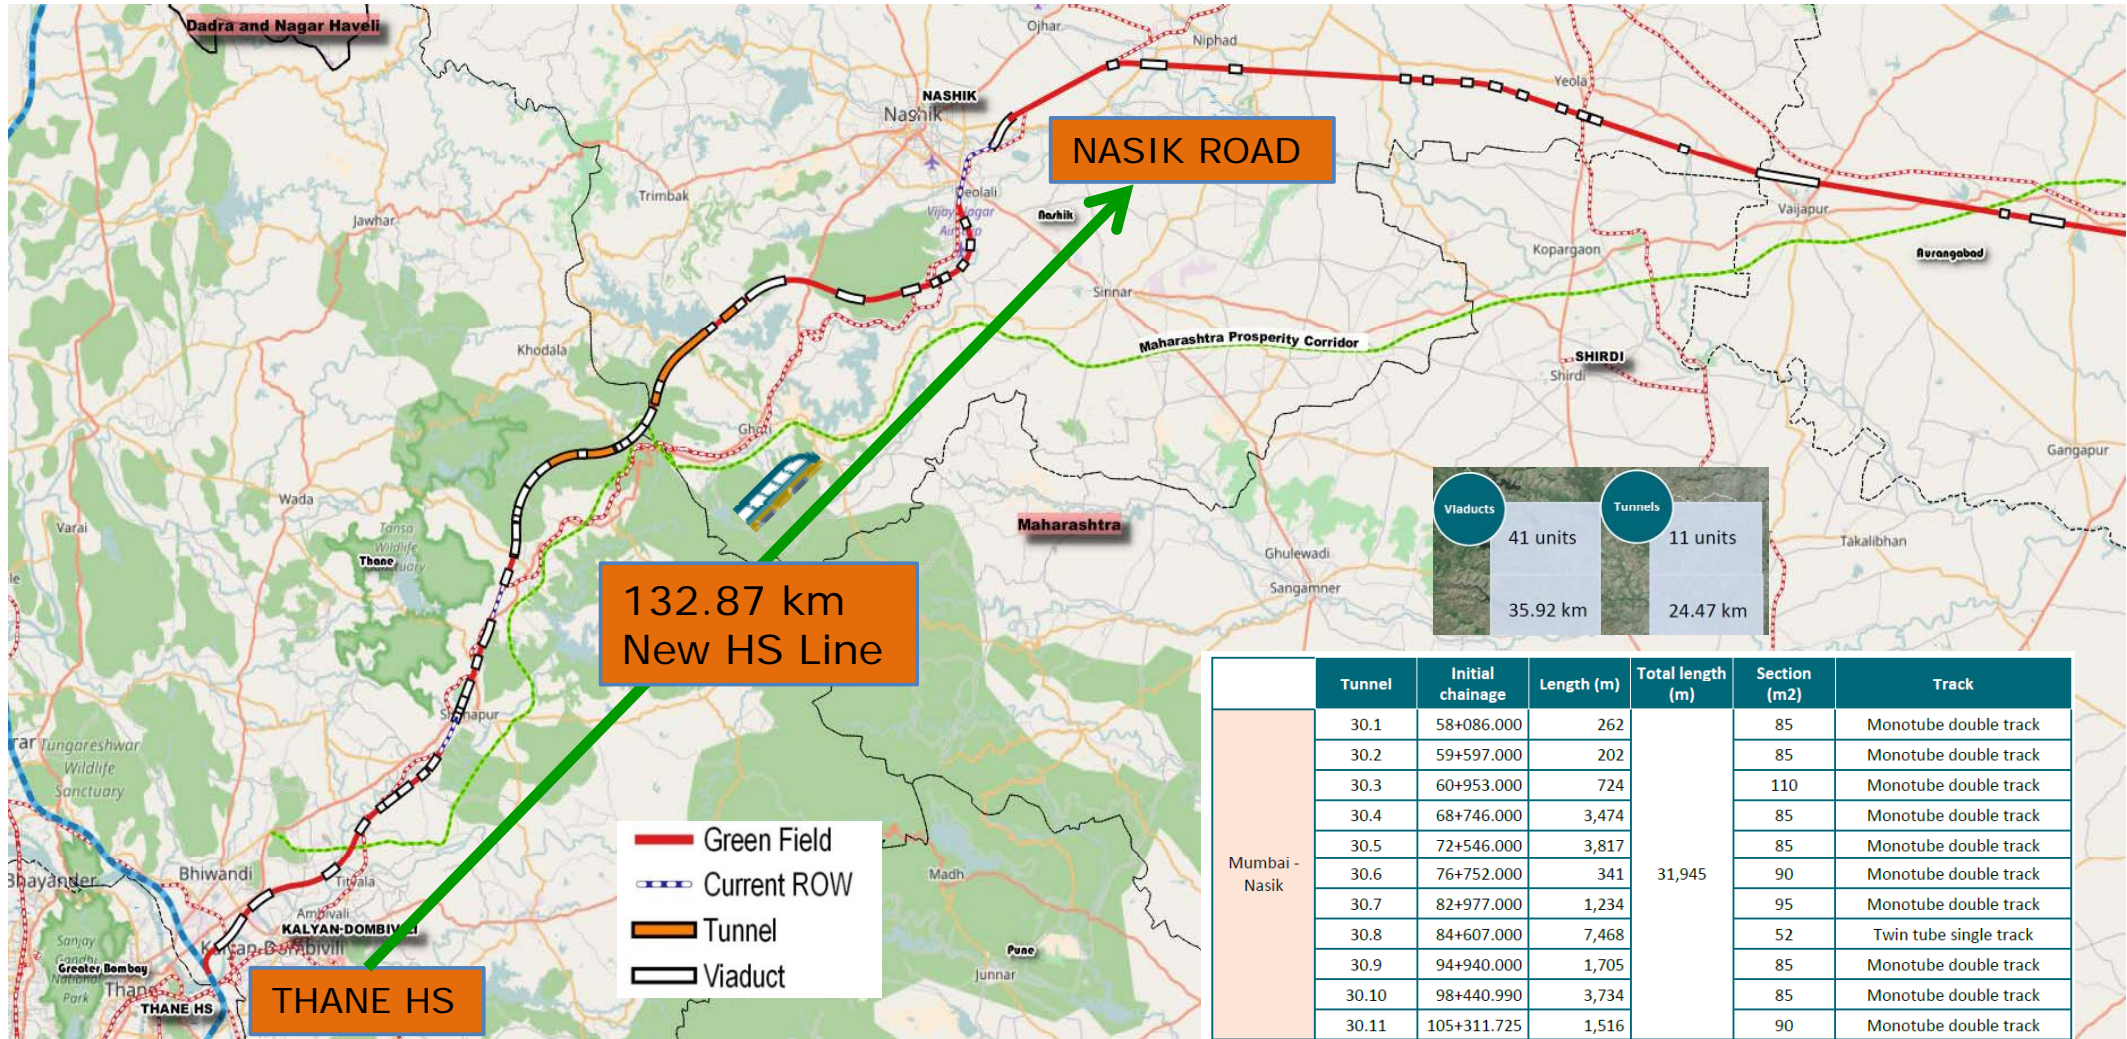

Mumbai - Nasik Conventional Train

3h 35m

Mumbai BKC - Thane HS – Nasik High Speed Services

47m

## Exploitation Possibility of extending service typology to increase high speed line use

- Apart from the trainsets to be used in the core service, other trains could use the line...
  - Offering low cost travel to attract new passengers
  - Extending their journey through conventional network to reach new destinations
  - Variable Gauge trains HS EMUs (TALGO or CAF) to be used to set exploitation plan.
  
- Trained high speed rolling stock could offer new (and attractive) possibilities
  - Locomotives would remain inside the line and only the less-expensive part of the train would continue beyond
  - As much as 1400 quality standard class seats per train (although beds are also possible)

### Talgo Avril awarded by Renfe

22,5 M€ / train  
 (additional -10% if order extends)  
 521 seats (103+2 1<sup>st</sup> / 416 2<sup>nd</sup>)  
 200 m / 12 cars (3+8+1)  
 -43% operation cost per pax

# Exploitation

- 'Extended' pattern  
(initial approach)

HS 350 trains 

HS 250 Regional trains 

HS 230 LD trailed trains 

# Demand forecast for the Mumbai-Nagpur HSRL

## Typical Section Power Calculation

Thane HS – Nasik  
2 Substations  
Pk 30 Pk 107

2 x 30/60 MVA each

Calculated for the worst degraded situation of trains run

## THANE – NASIK ROAD INFRASTRUCTURE

National Highway 160 **147 km**

38.000 veh/daily

22.000 car & motorcycles

4.000 buses & other type of vehicles

12.000 trucks

Travel time & average speed from Greater Mumbai

|          | <u>h</u> | <u>km/h</u> |
|----------|----------|-------------|
| to Thane | 1.5      | 49.4        |
| to Nasik | 2.9      | 58.1        |

### Buses operated by Maharashtra State Road Transport Corporation MSRTC

| to Nasik    | round services / daily |         |
|-------------|------------------------|---------|
| from Mumbai | 33                     | 4 – 5 h |
| from Thane  | 35                     | 3 – 4 h |

## RAILWAY INFRASTRUCTURE

### Mumbai Suburban Rail Network (Central)

Mumbai CST – Thane km 33.02 – Kasara km 120.83 (293 m over sea level)

### Indian Railways **154 km**

Mumbai CST – Kasara - Igatpuri km 136,76 (589 m o.s.l.) –

- Nasik Road km 187,08 (564 m o.s.l.)

Travel time Mumbai CST – Nasik Road 3h 30 min

Split of the rail demand using the ticket reservation system

## THANE HS – NASIK HS HIGH SPEED TRAINS 133 km

Simulation of Energy Consumption show us that for HS Train is **0,0361 kWh/pass-km**, just double that those for Conventional Trains

*This coincides with Unitary Values used on Macro approach*

## THANE – NASIK ROAD CONVENTIONAL TRAINS 154 km

| Train                  | Line             | Max. Speed | Passengers / train (aprox.) | INCOME OF ENERGY FROM ELECTRICITY NET (kWh) | NET CONSUMPTION OF ENERGY (kWh) | NET CONSUMPTION OF ENERGY BY KM (kWh/km) | NET CONSUMPTION OF ENERGY BY PASS-KM (kWh / pass-km) | TRAVEL TIME (hh:mm:ss) |
|------------------------|------------------|------------|-----------------------------|---|---------------------------------|--|--|------------------------|
| Loc WCAM3 + 18 Coaches | Thane-Nasik Road | 80         | 1.440                       | 4.014,0                                     | 4.014,00                        | 26,10                                    | 0,0181   | 2:23:44                |
| Talgo Avril            | Thane-Nasik AV   | 300        | 1.042                       | 5.466,8                                     | 5.002,80                        | 37,60                                    | 0,0361   | 0:31:23                |

Main traffics from Great Mumbai, Thane, Pune towards Nasik, Jalgaon & Nagpur

### Scenario 2035 without Project

**Total Passengers/day 180.403**  
Railway 106.366

Origin of HS passengers. Year 2035

- Air
- Bus
- Car
- Rail
- HS

**Total Passengers/day 190.903**  
 Railway 132.266  
 Conv. Railway 86.766  
**HSR 45.500**

From Rail and other modes 35.000  
 Induced HS passengers 10.500

From GM, Thane, Pune  
 to Nasik 34.494 76%  
 to Nagpur&Jalgaon 11.006 24%

### Scenario 2035 with Project

**THE IMPORTANCE OF INCLUDING TRAFFICS "BEYOND"**

RESULTS → SAVINGS

| YEARLY SAVINGS ON 2035 SCENARIO   |   | Thousands Ton CO <sub>2</sub> | Million l. equiv. Fuel |
|---|---|-------------------------------|------------------------|
| ESTIMATED YEARLY SAVINGS MAIN TRAFFICS<br>(Mumbai/Pune/Thane - Nasik)         | Savings with HS (without Induc. traff.) | 17,9                          | 2,9                    |
|   | Savings with HS Induced                 | -7,6                          | -5,7                   |
| YEARLY SAVING FROM MAIN TRAFFICS OVER LINES BEYOND NASIK<br>(Jalgaon, Nagpur) | Savings with HS (without Induc. traff.) | 61,9                          | 18,3                   |
|   | Savings with HS Induced                 | 45,0                          | 12,5                   |
| ESTIMATED YEARLY SAVINGS TOTAL MAIN TRAFFICS                                  | Savings with HS (without Induc. traff.) | 79,8                          | 21,2                   |
|   | Savings with HS Induced                 | 37,4                          | 6,8                    |

(A)

We have considered **two categories of main traffics:**

- Main traffics to/from Nasik
- Main traffics to/from beyond Nasik

Only in one year, we have estimated: **savings of 79,8 thousand Ton CO<sub>2</sub> and 21,2 Million liter equivalent of Fuel,**

in both cases with a high relevance of savings from traffics beyond Nasik (by conventional trains, more economic in terms of this two characteristics).

Negative savings originated by induced HS passengers are **well recuperated by effects from passengers beyond Nasik**, with a final result of **21,2 thousand Ton CO<sub>2</sub> and 6,8 Million liter equiv of Fuel saved**

YEARLY SAVINGS 2035 SCENARIO

YEARLY SAVINGS 2035 SCENARIO

**B**

| SAVINGS ON 2035 SCENARIO (Crores)   |   | Accidents    | Climate Change | Environment Impact | TOTAL SAVINGS |
|---|---|--------------|----------------|--------------------|---------------|
| ESTIMATED YEARLY SAVINGS MAIN TRAFFICS<br>(Mumbai/Pune/Thane - Nasik)         | Savings with HS (without Induc. traff.) | 102,8        | 69,9           | 67,6               | 170,3         |
|   | Savings with HS Induced                 | 100,6        | 64,5           | 15,2               | 115,8         |
| YEARLY SAVING FROM MAIN TRAFFICS OVER LINES BEYOND NASIK<br>(Jalgaon, Nagpur) | Savings with HS (without Induc. traff.) | 72,9         | 162,9          | 159,8              | 232,6         |
|   | Savings with HS Induced                 | 71,4         | 159,4          | 124,9              | 196,4         |
| ESTIMATED YEARLY SAVINGS TOTAL MAIN TRAFFICS                                  | Savings with HS (without Induc. traff.) | 175,6        | 232,8          | 227,3              | 403,0         |
|   | Savings with HS Induced                 | <b>172,1</b> | 223,9          | <b>140,1</b>       | <b>312,2</b>  |

Reduction of Accidents cost owing to introduction of HSR will reach **172,1 Crores on year 2035**, with a minor impact from induced traffic (as the very low accident index of HSR).

Among Savings related with **Environmental items**, highest value belongs to **Climate Change** (Greenhouse Gases emissions into the atmosphere through fuel combustion directly or indirectly), with **223,9 Crores/year**.

Taking into account the whole set of **Environmental items**, this saving is reduced to **140,1 Crores**, but **Total Savings for all concepts** reach **403 Crores** without consideration of Induced traffic and **312,2 Crores** if we include it

YEARLY SAVINGS 2035 SCENARIO

Accidents (Crores)

YEARLY SAVINGS 2035 SCENARIO

Accidents + Environmental Impact (Crores)

## Application on Conventional Line CL / section Nasik-Bushaval

Spreading High Speed Rail Benefits through actions on Conventional Lines in Indian Railways network

### A MAIN CONCLUSION

The relevant importance that HSR reaches in terms of **Energy and Environmental savings**, around 400 Crores/year over the section Thane HS – Nasik, but also the weight that traffic coming from connected conventional lines reaches, so the importance of acting over them to get the full benefit HSR can obtain

### KEY STRATEGY

#### Current state of Infrastructure

- \* Good alignments and Track quality
- \* Good quality of Electrification / Energy
- \* Maximum Speed 110 km/h
- \* Degree of use of capacity around 130%

#### Our performance proposals (PILOT OPERATION):

- #: Enhance safety
- #: Increase capacity
- #: Increase speed

acting on

**Signalling,**  
**Optimized Traffic Control Operations**  
**Train Protection ERTMS**  
**Level Crossings Protection**

## Spreading High Speed Rail Benefits through actions on Conventional Line Nasik – Bhusaval

### Updates in Signalling, Train Protection, Level Crossing, Communications & Track Access

- Automatic Train Protection
- OCC – Train Communication System
- New Track Sections Fencing
- Automatic Level Crossing Protection
- Electronic Interlocking
- Centralized Traffic Control Center

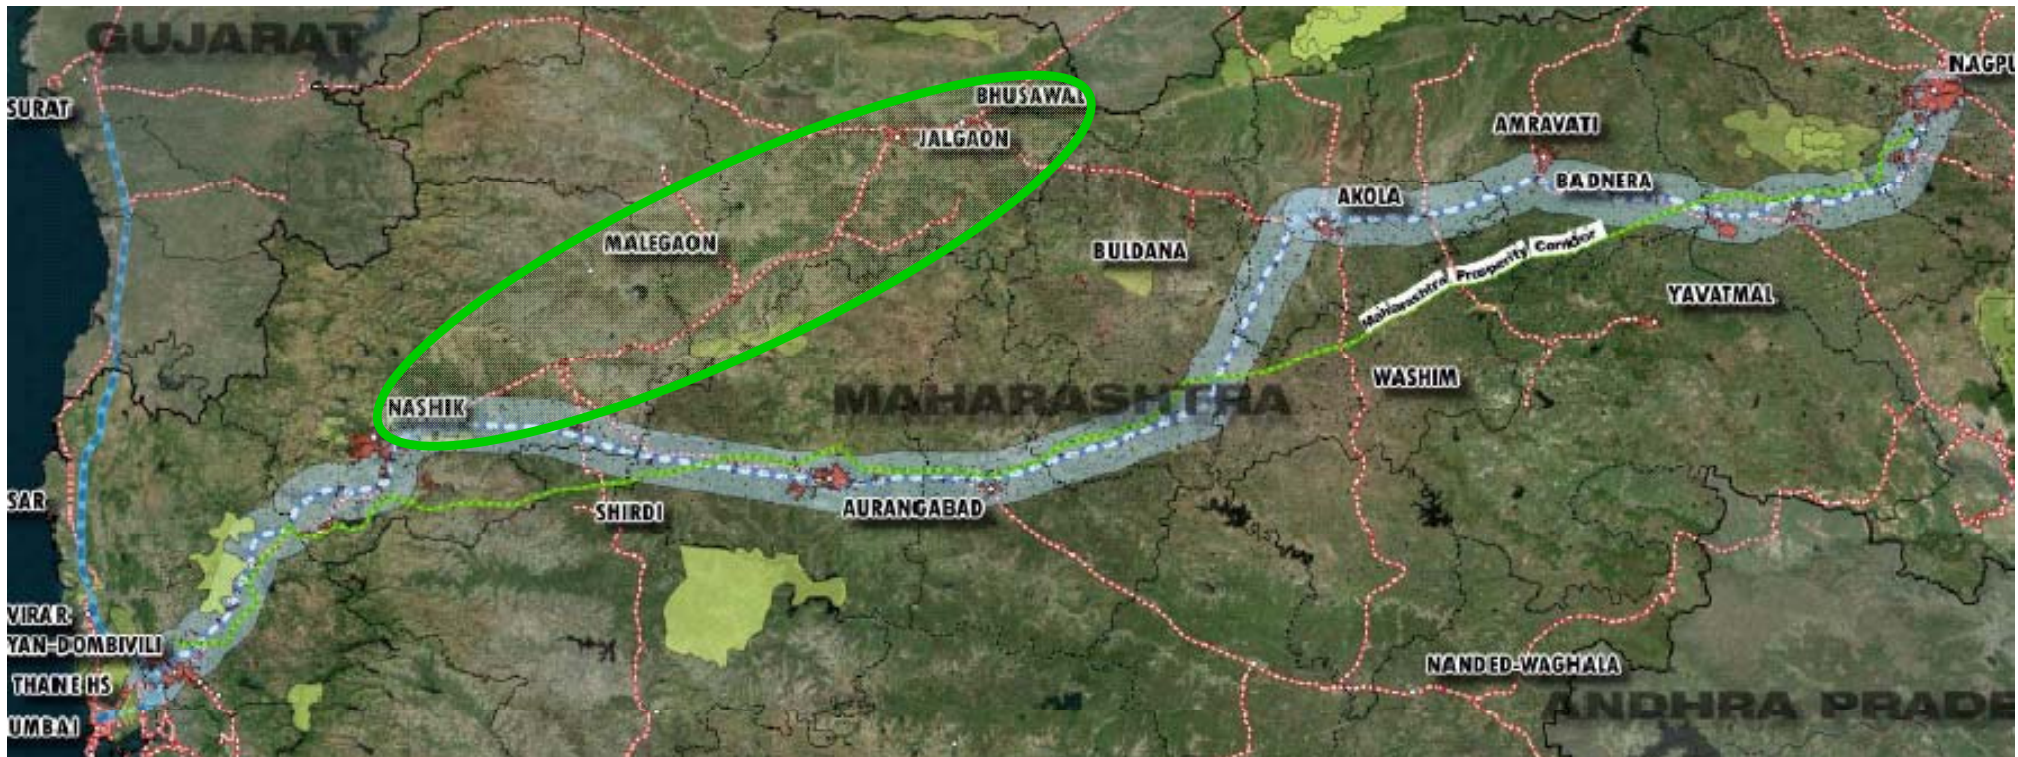

## Application on conventional line CL / section Nasik-Bushaval

Total length of CL to be improved 255,04 km

### Travel time

|                         |                   |           |             |                                 |
|-------------------------|-------------------|-----------|-------------|---------------------------------|
| Mumbai BKC – Nasik Road | CL                | 3h 25 min | 55,34 km/h  | <i>Bushaval from Mumbai BKC</i> |
