# PARTNERSHIP TO ADVANCE CLEAN ENERGY-DEPLOYMENT (PACE-D) TECHNICAL ASSISTANCE PROGRAM

---

## Strategy for the Procurement of Renewable Energy for the Indian Railways

*Presented by*  
USAID/India

# PACE-D TA Program's engagement with the Indian Railways (IR) was initiated with a common objective of scaling up solar rooftop deployment

# The Program worked with the Railway Board & REMC to develop and institutionalize solar rooftop procurement at IR

## UNDERSTANDING THE NEED

1

- Large potential for rooftops –9,500 installations
- Simple procurement and deployment process
- Easy to institutionalize & scale up

## INSTITUTIONALIZING DEPLOYMENT

3

- Prepared standard documents for procurement & contracting
- Assisted in aggregating and bidding 2 phases

---

## DEVELOPING DEPLOYMENT STRATEGY

2

- RESCO model selected
- No investment and risk for IR
- RESCOs, specialized players, operate better
- Easy to scale

## REFINING THE STRATEGY

4

- Revised strategy based on learning from each bid
- Selected CAPEX model for small scale projects

# The cornerstone of PACE-D support to IR has been the goal of scaling up solar rooftop

## 50 MW Rooftop Project

- 1<sup>st</sup> procurement with standard bidding documents
- Zonal Bidding
- 32 MW bid out to 19 developers

### Key Learnings:

- The need to centralize bidding process to bring in efficiency of procurement & provide scale

## 100 MW Rooftop – Phase I

- Redesigned bid documents
- Central procurement through REMCL
- 48 MW bid out to 2 developers
- Tariff Range: INR 4.58-4.98

### Key Learnings:

- Small rooftop capacities not preferred
- Simultaneous tenders constrained the bandwidth of developers

## 67 MW Rooftop – Phase 2

- Revised strategy to focus on large to medium sized roofs
- All 67 MW bid to 5 bidders
- Tariff Range: INR 2.68-4.49

### Key Learnings:

- CAPEX model for small rooftop

## 4.75 MW rooftop - CAPEX

- Revised strategy for CAPEX model
- Developed framework and bid documents
- In process of launching the procurement

# Indian Railways Goals & Targets for Electrification & Renewable Energy

Consumes  
**1.8%**  
of total electric  
energy  
generated in  
India  
**Largest Electricity  
Consumer**

Electrify 90% of all Rail Routes

Carbon Neutrality by 2030

1 GW of solar power by 2020

Achieve INR 41,000 Crore  
energy savings by 2025

10% of IR's energy  
from RE by 2020

Meet NAPCC targets

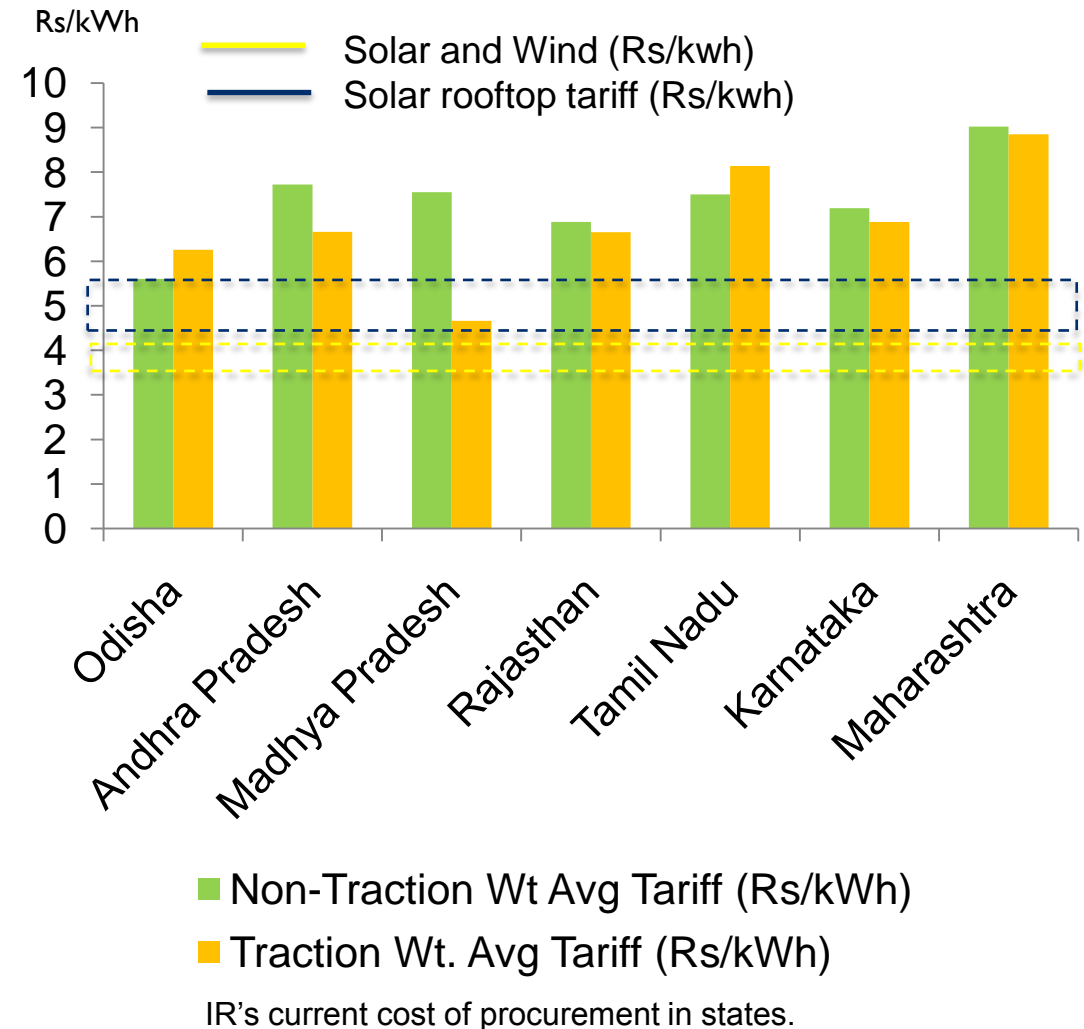

# Comprehensive Strategy needed due to Complexities in RE Procurement

## RE Options

- Decentralized generation stations i.e., solar rooftop for all non traction loads
- Centralized generation stations i.e., large-scale solar & wind projects for all traction and bulk non-traction loads

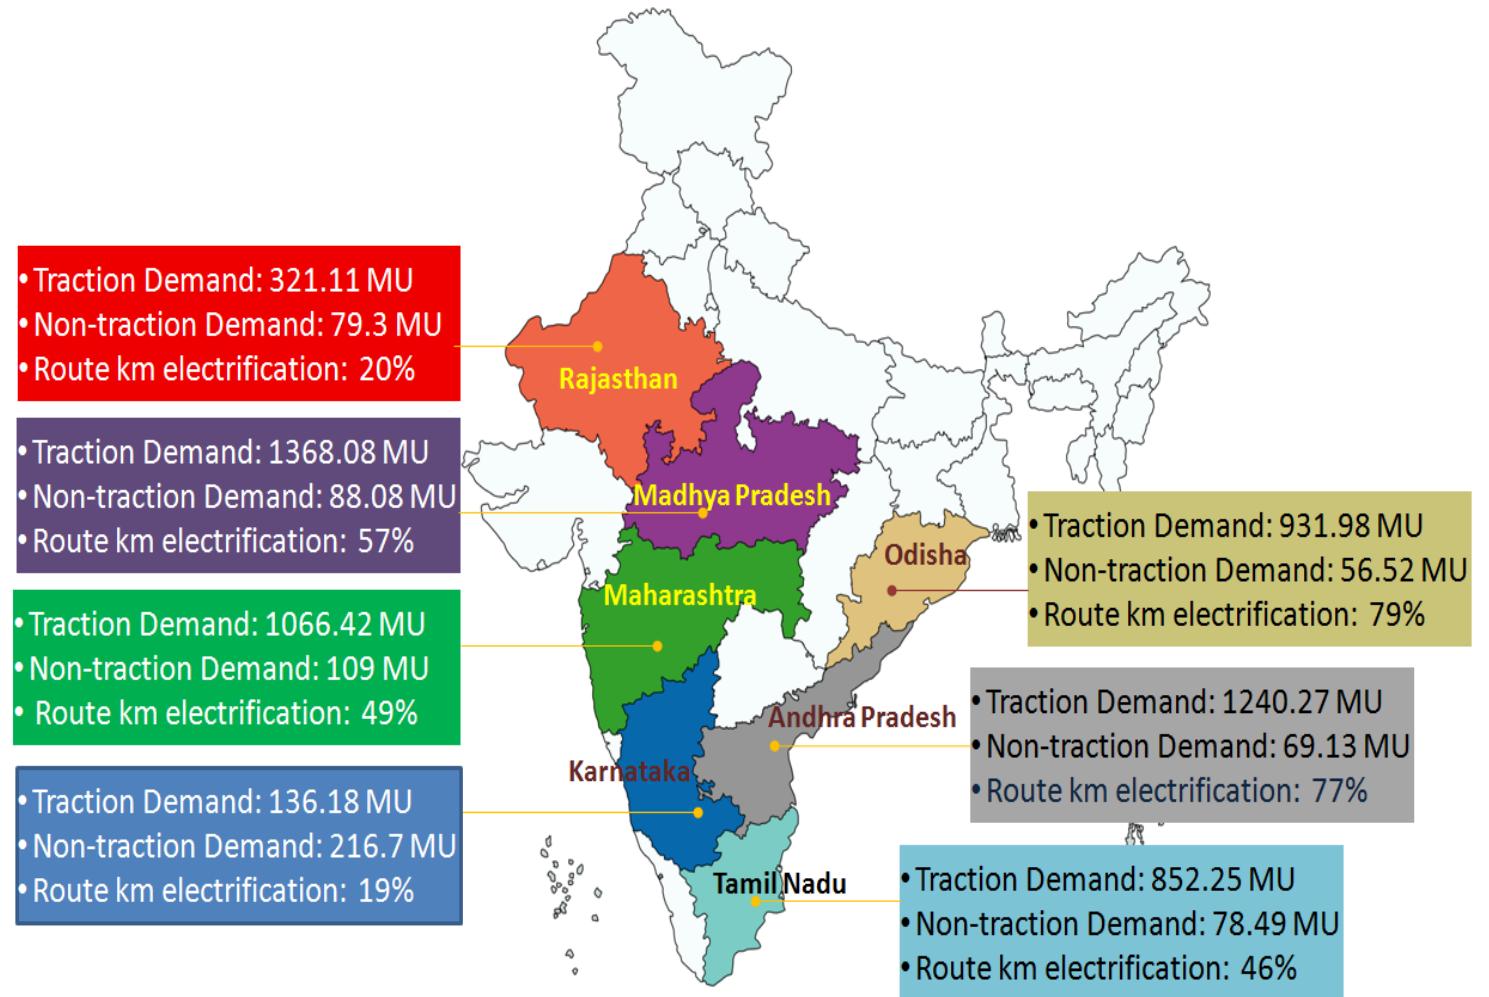

## Challenges

- Capital intensive
- On site captive generation from large projects not feasible
- Regulatory Framework
- Open Access charges
- Infirm nature of power
- DISCOM reluctance as IR is a high value customer

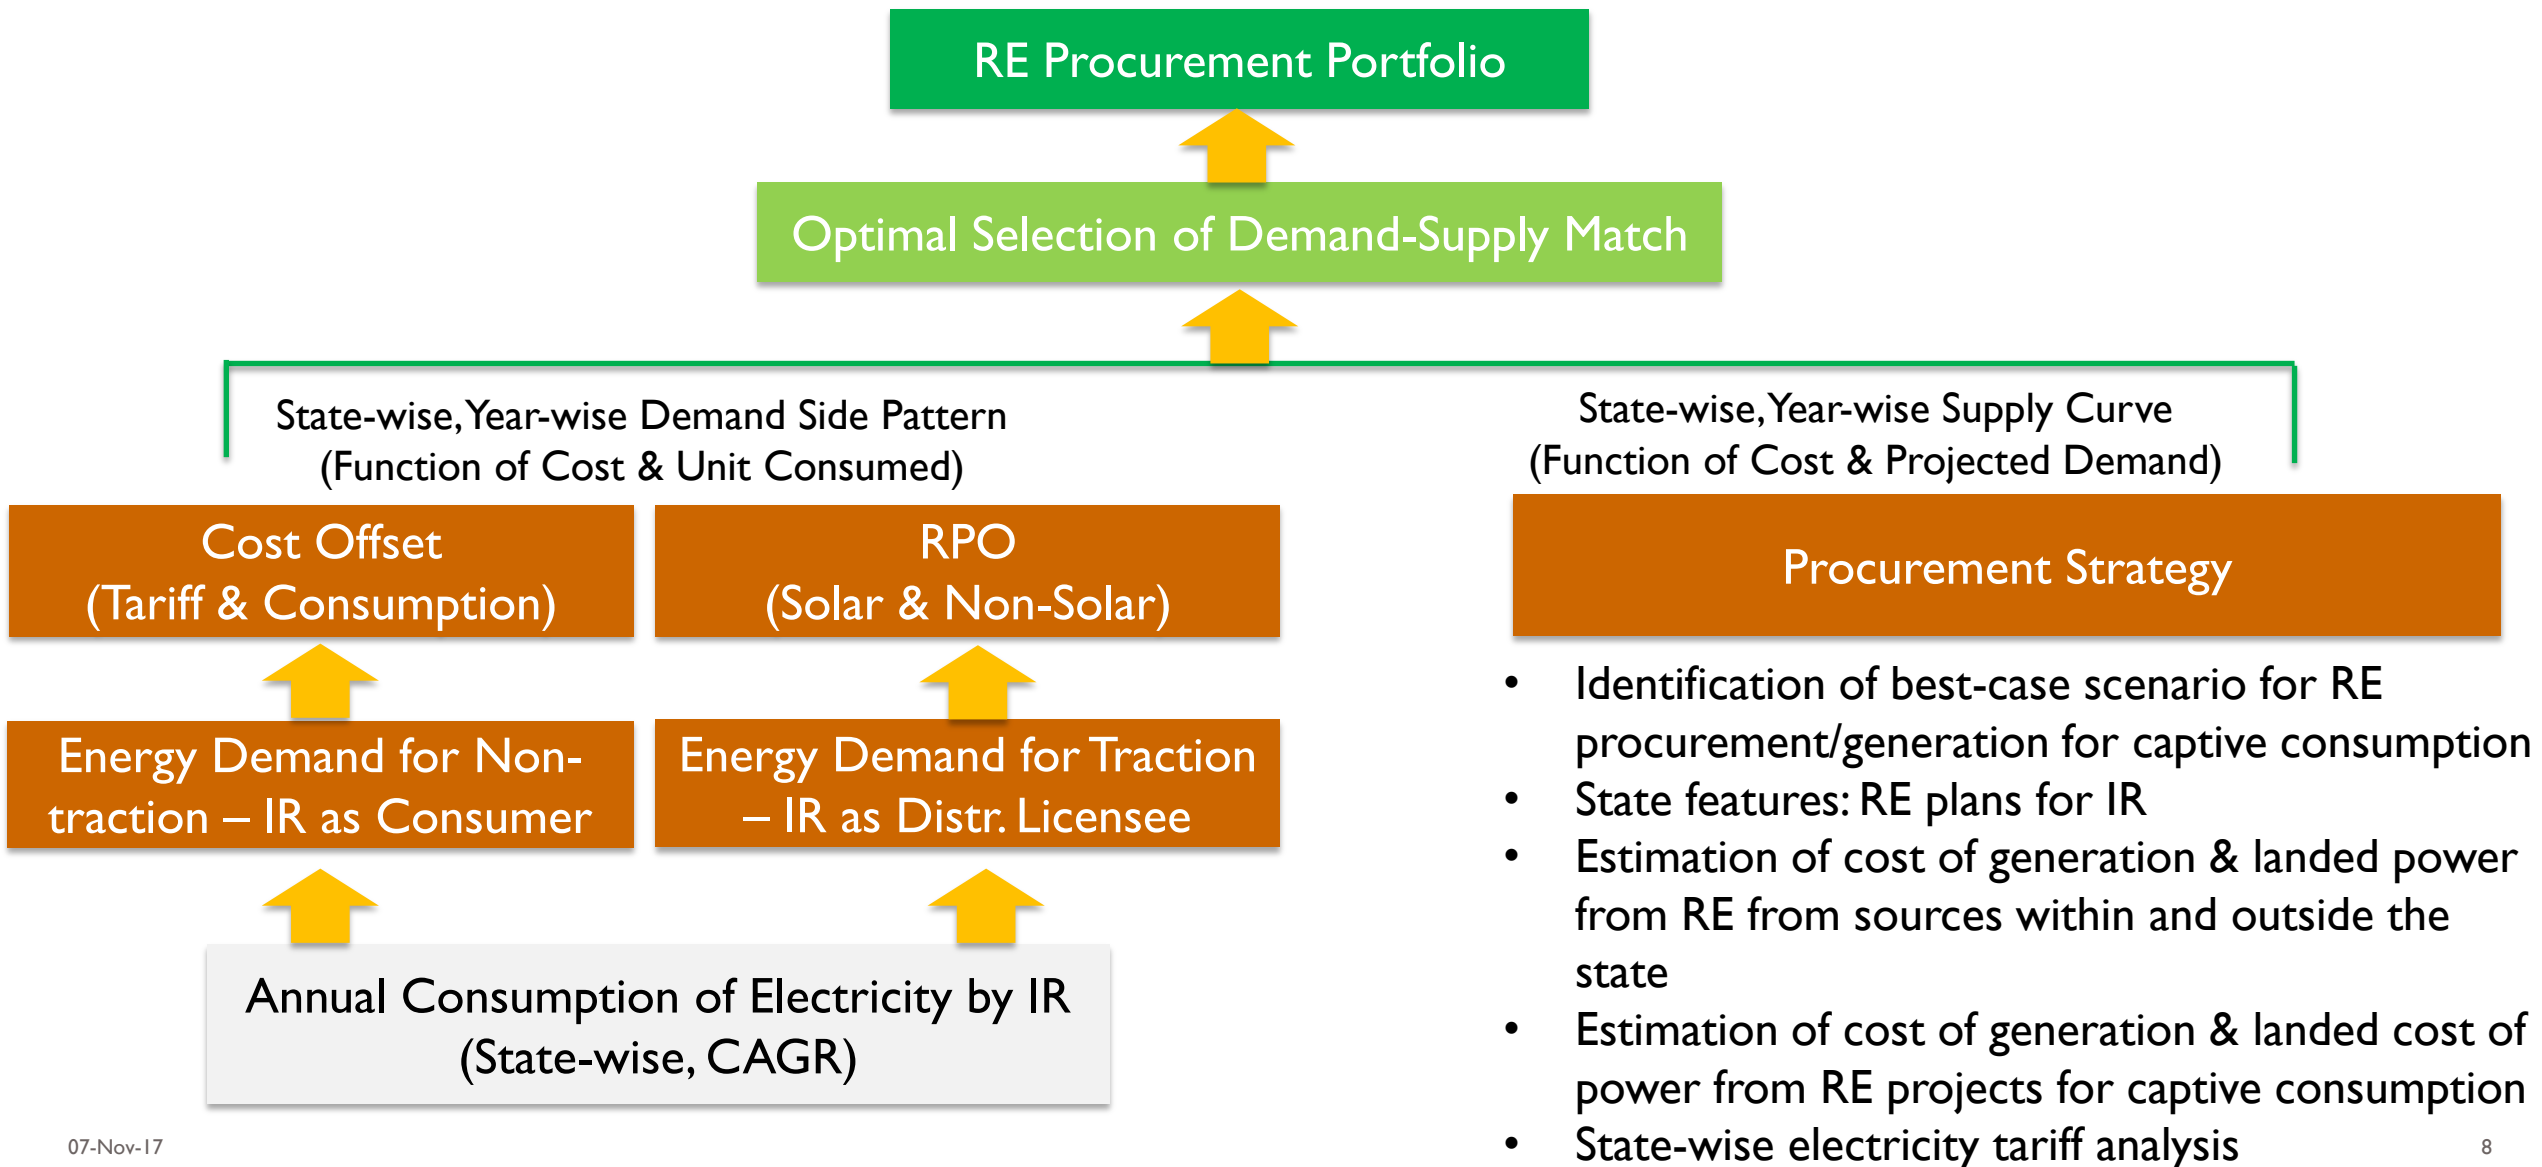

# Objective - To maximize benefits within constraints

- PACE-D TA Program carried out a study and developed a strategy to:
  - Meet IR's RPO target (for traction loads) at cheapest available option
  - Reduce energy costs (traction & non-traction) with renewable energy
- Selected 7 states for the study:
  - High tariffs
  - Good solar and wind potential
  - Availability of policy and regulations
  - High electricity demand

# Approach for Design of Procurement Strategy

# Regulatory Constraints for RE Development

## Net Metering – Solar Rooftop

- Capacity limited to sanctioned load
- Maximum allowed capacity - 1 MW
- Constrained by DT capacity
- Net metering regulations across states

## Open Access

- Minimum allowed load - 1 MW
- OA regulations across states
- OA charges for RE projects waived off in part or full in few states
- Banking allowed in few states

The strategy for Indian Railway's RE procurement has been devised based on these constraints.

# IR Procurement Options: Applicable Charges for Procuring RE

|                           | Power procured from | Power drawn through | Source state |      | CTU | Destination State |      |        |     |       |
|---------------------------|---------------------|---------------------|--------------|------|-----|-------------------|------|--------|-----|-------|
|                           |                     |                     | STU          | SLDC |     | STU               | SLDC | DISCOM | CSS | Other |
| Sourced from other states | STU                 | DISCOM              | √            | √    | √   | √                 | √    | √      | √   | √     |
|                           | STU                 | STU                 | √            | √    | √   | √                 | √    |        |     |       |
|                           | CTU                 | STU                 |              |      | √   | √                 | √    |        |     |       |
|                           | CTU                 | DISCOM              |              |      | √   | √                 | √    | √      | √   | √     |
| Sourced from within the   | STU                 | STU                 |              |      |     | √                 | √    |        |     |       |
|                           | STU                 | DISCOM              |              |      |     | √                 | √    | √      | √   | √     |
|                           | DISCOM              | DISCOM              |              |      |     |                   |      | √      | √   | √     |

- RE procurement strategy devised from:
  - Analysing regulatory constraints in state
  - Selecting cheapest landed cost option for solar/wind
- E.g. For Karnataka, OA charges exempted till March 2018, making intra-state solar (rooftop & ground-mounted systems) most favourable procurement option

**Charges for STU, CTU and DISCOM include both charges and losses**

STU – State Transmission Utility  
 CSS – Cross Subsidy Surcharge

SLDC - State Load Dispatch Centre  
 CTU – Central Transmission Utility

DISCOM – Distribution Company

# Supply Options for Karnataka

Inter-state Transmission Charges

Intra-state Transmission Charges

Inter-state Transmission Charges

Intra-state Transmission Charges

- Based on the injection and withdrawal location, OA charges vary
- OA charges for solar and wind vary
- Power procured from Karnataka at INR 4.5/kWh can still be cheaper than power procured from other state at INR 3/kWh

## Proposed RE Procurement Mix for 2022 - Karnataka

- All available roof space to be used for captive solar generation
- Solar and non solar RPO of traction load through OA within the state
- 75% demand of bulk non-traction loads (RWF) through OA within the state

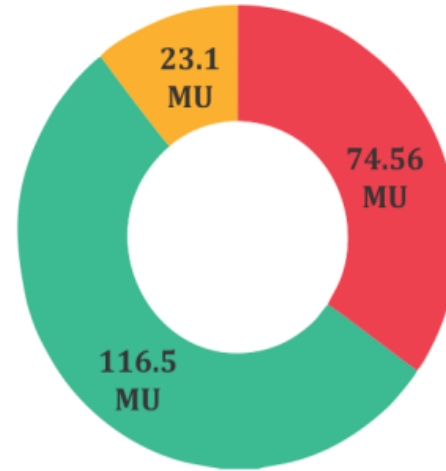

# RE Procurement Envisaged for Key States by 2022

Tamil Nadu

Andhra Pradesh

Odisha

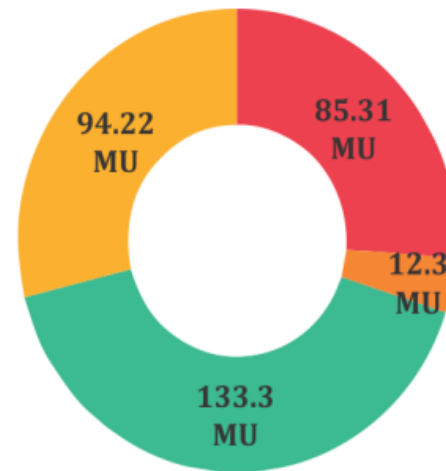

Madhya Pradesh

Rajasthan

Karnataka

Maharashtra

- Rooftop solar projects on IR buildings for non-traction load
- Ground mounted solar projects through OA (for meeting solar RPO)
- Ground mounted solar projects through OA for supplementing non-traction bulk loads
- Wind projects through OA (for meeting non-solar RPO)
- Wind projects OA for supplementing non-traction bulk loads

# Indian Railways: RE Savings Envisaged in 2021-22

# On Going Work - Decarbonisation of Traction Loads

## Challenges

- ❖ Difficulty in matching generation profile and load profile
- ❖ Scheduling power and load
- ❖ Regulatory requirements of states

## Objectives

- ❖ Understand maximum RE penetration levels
- ❖ Devise procurement strategy
- ❖ Assess the optimum need for energy storage
